Please provide the following information, and submit to the NOAA DM Plan Repository.

Reference to Master DM Plan (if applicable)

As stated in Section IV, Requirement 1.3, DM Plans may be hierarchical. If this DM Plan inherits provisions from a higher-level DM Plan already submitted to the Repository, then this more-specific Plan only needs to provide information that differs from what was provided in the Master DM Plan.

URL of higher-level DM Plan (if any) as submitted to DM Plan Repository:

1. General Description of Data to be Managed

1.1. Name of the Data, data collection Project, or data-producing Program:
2014 USGS NRCS Lidar: Choctaw and Washington Counties, AL

1.2. Summary description of the data:
This is a subset of data covering Alabama counties of Choctaw and Washington.

The full collection data set is comprised of lidar point cloud data, raster DEM, hydrologic 3-d breaklines, raster intensity, survey control, project tile index, and project data extent. This task order requires lidar data to be acquired in two separate AOI’s over 10 counties in Mississippi; Attala, Leake, Lexington, Montgomery, Scott, Smith, Webster Counties and a portion of Carroll, Choctaw and Jasper Counties and two counties in Alabama; Washington and Choctaw. AOI is approximately 7,400 square miles.

The lidar sensor uses a combination of laser range finding, GPS positioning, and inertial measurement technologies. The lidar systems collect data point clouds that are used to produce highly detailed Digital Elevation Models (DEMs) of the earth’s terrain, man-made structures, and vegetation. The task required the LiDAR data to be collected at a nominal pulse spacing (NPS) of 0.7 meters. The final products include classified LAS, one (1) meter pixel raster DEMs of the bare-earth surface in ERDAS IMG Format, and 8-bit intensity images. Each LAS file contains lidar point information, which has been calibrated, controlled, and classified. Additional deliverables include hydrologic breakline data, control data, tile index, lidar processing and survey reports in PDF format, FGDC metadata files for each data deliverable in .xml format, and LAS swath data. Collected swath files that were that were larger than 2GB were provided in multiple sub-swath files, each less than 2GB. Ground conditions: Water at normal levels; no unusual inundation; no snow; leaf off.

This metadata record only covers the classified LAS data.

Contract Information:

TASK NAME: USGS-NRCS Laurel MS 0.7m NPS LIDAR
Lidar Data Acquisition and Processing Production Task
USGS Contract No. G10PC00057
1.3. Is this a one-time data collection, or an ongoing series of measurements?  
One-time data collection

1.4. Actual or planned temporal coverage of the data:  

1.5. Actual or planned geographic coverage of the data:  
W: -90.73, E: -87.63, N: 33.79, S: 31.01

1.6. Type(s) of data:  
(e.g., digital numeric data, imagery, photographs, video, audio, database, tabular data, etc.)  
Model (digital)

1.7. Data collection method(s):  
(e.g., satellite, airplane, unmanned aerial system, radar, weather station, moored buoy, research vessel, autonomous underwater vehicle, animal tagging, manual surveys, 
 enforcement activities, numerical model, etc.)

1.8. If data are from a NOAA Observing System of Record, indicate name of system:  

1.8.1. If data are from another observing system, please specify:

2. Point of Contact for this Data Management Plan (author or maintainer)

2.1. Name:  
NOAA Office for Coastal Management (NOAA/OCM)

2.2. Title:  
Metadata Contact

2.3. Affiliation or facility:  
NOAA Office for Coastal Management (NOAA/OCM)

2.4. E-mail address:  
coastal.info@noaa.gov

2.5. Phone number:  
(843) 740-1202
3. Responsible Party for Data Management

Program Managers, or their designee, shall be responsible for assuring the proper management of the data produced by their Program. Please indicate the responsible party below.

3.1. Name: 

3.2. Title: 
Data Steward

4. Resources

Programs must identify resources within their own budget for managing the data they produce.

4.1. Have resources for management of these data been identified? 
Yes

4.2. Approximate percentage of the budget for these data devoted to data management (specify percentage or "unknown"): 
Unknown

5. Data Lineage and Quality

NOAA has issued Information Quality Guidelines for ensuring and maximizing the quality, objectivity, utility, and integrity of information which it disseminates.

5.1. Processing workflow of the data from collection or acquisition to making it publicly accessible (describe or provide URL of description):

Lineage Statement:

Data were acquired and processed by Woolpert under contract to USGS. Data were found to have several issues during USGS quality assurance testing, but could not be found on USGS systems. A copy was obtained from the Alabama Department of Transportation in a different projection. Some of the issues found by USGS were addressed by NOAA, though not all.

Process Steps:
- 2014-02-15 00:00:00 - Using one Leica ALS70 (lidar) and one Optech Gemini (lidar) system on board a Cessna 404 and Cessna 310 aircraft respectively, high density data, at a nominal pulse spacing (NPS) of 0.7 meters, were collected for this task order (approximately 7,400 square miles). Leica Specs- AGL = 1981 meters - Aircraft Speed = 150 Knots, Field of View (Full) = 40 degrees, Pulse Rate = 272 kHz, Scan Rate = 41.6 Hz, with an average side lap of 25%. Optech Specs- AGL = 1524 meters - Aircraft Speed = 130 Knots, Field of View (Full) = 24 degrees, Pulse Rate = 125 kHz, Scan Rate = 46 Hz, with an average side lap of 30%. Multiple returns were recorded for each laser pulse along with an intensity value for each return. Forty-one (41) missions were flown between January 7, 2014 and February 15, 2014. Twelve (12) Global Navigation Satellite System (GNSS) Base Stations were used in support of the lidar data acquisition. Specific information regarding latitude, longitude, and
ellipsoid height to the L1 phase center is included in the lidar processing report. The
geoid used to reduce satellite derived elevations to orthometric heights was
GEOID12A. Data for the task order is referenced to the UTM Zone 16N, North
American Datum of 1983 (2011), and NAVD88, in meters. Once the data acquisition
and GPS processing phases are complete, the lidar data was processed immediately
to verify the coverage had no voids. The GPS and IMU data was post processed
using differential and Kalman filter algorithms to derive a best estimate of
trajectory. The quality of the solution was verified to be consistent with the
accuracy requirements of the project. The SBET was used to reduce the lidar slant
range measurements to a raw reflective surface for each flight line. The coverage
was classified to extract a bare earth digital elevation model (DEM) and separate
last returns. The ALS70/Optech Gemini calibration and system performance is
verified on a periodic basis using Woolpert’s calibration range. The calibration
range consists of a large building and runway. The edges of the building and control
points along the runway have been located using conventional survey methods.
Inertial measurement unit (IMU) misalignment angles and horizontal accuracy are
calculated by comparing the position of the building edges between opposing flight
lines. The scanner scale factor and vertical accuracy is calculated through
comparison of lidar data against control points along the runway. Field calibration
is performed on all flight lines to refine the IMU misalignment angles. IMU
misalignment angles are calculated from the relative displacement of features
within the overlap region of adjacent (and opposing) flight lines. The raw lidar data
is reduced using the refined misalignment angles.

- 2013-11-14 00:00:00 - Ground control and QAQC control point survey for the
Mississippi AOI was performed by Woolpert surveyors, to support the USGS-NRCS
Laurel MS 0.7m NPS Lidar project. All surveys were performed in such a way as to
achieve ground control that supports lidar data at 9.25 cm RMSE accuracy and
satisfy a local network accuracy of 5 cm at a 95% confidence level. All ground
control survey field activities took place from 11/13/2013 thru 11/23/13. Woolpert
collected control data for data processing as supplemental QAQC points. The
supplemental QAQC points were collected to be used in independent accuracy
testing. The field crew utilized Real-Time Kinematic (RTK) GPS surveying
throughout most of the ground control data collection process. Using RTK GPS
techniques, observations were performed on 26 ground control points and 161
quality control check points. The survey was conducted using a 1-second epoch rate,
in a fixed solution RTK mode, with each observation lasting between 60 to 180
seconds. Each station was occupied twice to insure the necessary horizontal and
vertical accuracies were being met for this photogrammetric project. In addition to
the RTK GPS techniques, the project field crew utilized rapid-static (RS) GPS
surveying techniques to establish RTK Base stations within areas lacking sufficient
NGS control monument stations. Using Rapid-Static GPS techniques, observations
were performed on one (2) RTK Base stations (110 & 111). The survey was
conducted at a 5-second sync rate with each observation lasting between 40-360
minutes. All horizontal GPS control was based on UTM Zone 16N, NAD83 (2011)
expressed in meters. The vertical datum used for this project was based on the North American Vertical Datum of 1988 (NAVD88), GEOID12A, also expressed in meters.

- 2014-01-25 00:00:00 - Ground control and QAQC control point survey for the Alabama AOI was performed by Magnolia River surveyors, to support the USGS-NRCS Laurel MS 0.7m NPS Lidar project. All surveys were performed in such a way as to achieve ground control that supports lidar data at 9.25 cm RMSE accuracy and satisfy a local network accuracy of 5 cm at a 95% confidence level. All ground control survey field activities took place from 01/24/2014 thru 04/03/14. Magnolia River surveyors collected control data for data processing as supplemental QAQC points. The supplemental QAQC points were collected to be used in independent accuracy testing. The field crew utilized Real-Time Kinematic (RTK) GPS surveying utilizing the Alabama Departemnt of Transportation (ALDOT) Continually Operating Reference Station (CORS) network, via the internet using TCP/IP protocol and MiFi cellular connection. ALDOT provides single base corrections from the nearest operating GPS reference station. Using RTK GPS techniques, observations were performed on 21 ground control points and 115 quality control check points. The survey was conducted using a 1-second epoch rate, in a fixed solution RTK mode, with each observation lasting between 60 to 180 seconds. Each station was occupied twice to insure the necessary horizontal and vertical accuracies were being met for this photogrammetric project. A Sokkia Set330R3 total station in combination with a Trimble TSC3 data collector was used in areas where sufficient satellite coverage was not available for some quality control check points. All horizontal GPS control was based on UTM Zone 16N, NAD83 (2011) expressed in meters. The vertical datum used for this project was based on the North American Vertical Datum of 1988 (NAVD88), GEOID12A, also expressed in meters.

- 2014-01-08 00:00:00 - The individual flight lines were inspected to ensure the systematic and residual errors have been identified and removed. Then, the flight lines were compared to adjacent flight lines for any mismatches to obtain a homogenous coverage throughout the project area. The point cloud underwent a classification process to determine bare-earth points and non-ground points utilizing "first and only" as well as "last of many" lidar returns. This process determined Default (Class 1), Ground (Class 2), Noise (Class 7), Water (Class 9), Ignored Ground (Class 10), Overlap Default (Class 17) and Overlap Ground (Class 18). The bare-earth (Class 2 - Ground) lidar points underwent a manual QA/QC step to verify the quality of the DEM as well as a peer-based QC review. This included a review of the DEM surface to remove artifacts and ensure topographic quality. Classification of water (class 9) and ignored ground (class 10) was completed via the use of the hydrologic breaklines collected for the hydro-flattening phase. The overlap classes were determined by first identifying the overlapping areas and reclassifying the LAS data by offset from a corridor. This allows the returns located on the edge of the swath to be removed from the bare earth coverage in an effort to produce a more uniform data density. The returns determined to be overlap are then further classified to produce overlap default (class 17) and overlap ground (
class 18). The surveyed ground control points are used to make vertical adjustments to the data set and to perform the accuracy checks and statistical analysis of the lidar dataset. Supervisory QC monitoring of work in progress and completed editing ensured consistency of classification character and adherence to project requirements across the entire project area. The resulting deliverables for this task order consist of classified LAS file in LAS 1.2 format, Raw Swath LAS files in LAS 1.2 format, 1 meter pixel size DEM files in ERDAS IMG format, 1 meter pixel size 8-bit Intensity files in GeoTIFF format, and Hydrologic Breakline data in ESRI shape file format.

- 2021-04-02 00:00:00 - The Alabama counties for the full data set were not found at the USGS National Map, nor could copies of the data be found. The Alabama Department of Transportation provided NOAA Office for Coastal Management a copy of the data for the two counties. These were received in proprietary *.zlas format. The data were converted to *.laz format using the LASliberator software (https://github.com/LASliberator/LASliberator). The data were in NAD83(2011) Alabama State Plane West (US survey ft) projection with vertical feet. This is different than the original UTM data and there was no record of the transformation. Several issues about the dataset were noted by USGS, including: Global Encoding bit is set to 0 instead of 1  Point Misclassification (Buildings): 2 buildings remain present and are classified as ground.  Point Misclassification (Vegetation): Vegetation is systematically classified as bridges in the point cloud.  The global encoding bit was set to 1 using lasinfo. Class 17, with vegetation and bridge decks, was reset to class 1 (unclassified). The lasclassify program was run to classify vegetation and buildings. Any real bridge decks are now in the unclassified class. The two buildings classified as ground were not found or changed.  For ingest into the NOAA Data Access Viewer, the data were unprojected to geographic coordinates and the vertical component was converted to ellipsoid heights in meters by removing the GEOID12A model.  The global encoding bit was found to be incorrect (0 indicating GPS seconds of the week) and was changed to reflect adjusted GPS seconds. (Citation: Classified LAS)

5.1. If data at different stages of the workflow, or products derived from these data, are subject to a separate data management plan, provide reference to other plan:

5.2. Quality control procedures employed (describe or provide URL of description):

6. Data Documentation
The EDMC Data Documentation Procedural Directive requires that NOAA data be well documented, specifies the use of ISO 19115 and related standards for documentation of new data, and provides links to resources and tools for metadata creation and validation.

6.1. Does metadata comply with EDMC Data Documentation directive?
6.1.1. If metadata are non-existent or non-compliant, please explain:
   Missing/invalid information:
   - 1.7. Data collection method(s)
   - 3.1. Responsible Party for Data Management
   - 5.2. Quality control procedures employed
   - 7.1.1. If data are not available or has limitations, has a Waiver been filed?
   - 7.4. Approximate delay between data collection and dissemination
   - 8.3. Approximate delay between data collection and submission to an archive facility

6.2. Name of organization or facility providing metadata hosting:
   NMFS Office of Science and Technology

6.2.1. If service is needed for metadata hosting, please indicate:

6.3. URL of metadata folder or data catalog, if known:
   https://www.fisheries.noaa.gov/inport/item/64494

6.4. Process for producing and maintaining metadata
   (describe or provide URL of description):
   Metadata produced and maintained in accordance with the NOAA Data Documentation Procedural Directive: https://nosc.noaa.gov/EDMC/DAARWG/docs/EDMC_PD-Data_Documentation_v1.pdf

7. Data Access
   NAO 212-15 states that access to environmental data may only be restricted when distribution is explicitly limited by law, regulation, policy (such as those applicable to personally identifiable information or protected critical infrastructure information or proprietary trade information) or by security requirements. The EDMC Data Access Procedural Directive contains specific guidance, recommends the use of open-standard, interoperable, non-proprietary web services, provides information about resources and tools to enable data access, and includes a Waiver to be submitted to justify any approach other than full, unrestricted public access.

7.1. Do these data comply with the Data Access directive?
   Yes

7.1.1. If the data are not to be made available to the public at all, or with limitations, has a Waiver (Appendix A of Data Access directive) been filed?

7.1.2. If there are limitations to public data access, describe how data are protected from unauthorized access or disclosure:

7.2. Name of organization of facility providing data access:
   NOAA Office for Coastal Management (NOAA/OCM)
7.2.1. If data hosting service is needed, please indicate:

7.2.2. URL of data access service, if known:
https://coast.noaa.gov/dataviewer/#/lidar/search/where:ID=9276/details/9276

7.3. Data access methods or services offered:
Data is available online for bulk or custom downloads

7.4. Approximate delay between data collection and dissemination:

7.4.1. If delay is longer than latency of automated processing, indicate under what authority data access is delayed:

8. Data Preservation and Protection
The NOAA Procedure for Scientific Records Appraisal and Archive Approval describes how to identify, appraise and decide what scientific records are to be preserved in a NOAA archive.

8.1. Actual or planned long-term data archive location:
(Specify NCEI-MD, NCEI-CO, NCEI-NC, NCEI-MS, World Data Center (WDC) facility, Other, To Be Determined, Unable to Archive, or No Archiving Intended)
NCEI_CO

8.1.1. If World Data Center or Other, specify:

8.1.2. If To Be Determined, Unable to Archive or No Archiving Intended, explain:

8.2. Data storage facility prior to being sent to an archive facility (if any):
Office for Coastal Management - Charleston, SC

8.3. Approximate delay between data collection and submission to an archive facility:

8.4. How will the data be protected from accidental or malicious modification or deletion prior to receipt by the archive?
Discuss data back-up, disaster recovery/contingency planning, and off-site data storage relevant to the data collection
Data is backed up to tape and to cloud storage.

9. Additional Line Office or Staff Office Questions
Line and Staff Offices may extend this template by inserting additional questions in this section.
