## Acronyms and Abbreviations

ADCP - Acoustic Doppler Current Profiler
BiOp - Biological Opinion
BOEM - Bureau of Ocean Energy Management
BSS - Beaufort Sea State
BZ - Buffer Zones
DAQ - Data acquisition
dB - decibels
DSLR - Digital Single Lens Reflex
EA - Environmental Assessment
EPU - Electronic Processing Unit
ESA - Endangered Species Act
EEZ - Economic Exclusion Zone
EZ - Exclusion Zone
GPS - Global Positioning System
HF - High Frequency
HZ - Hertz
IHA - Incidental Harassment Authorization
ITS - Incidental Take Statement
LDEO - Lamont-Doherty Earth Observatory
LF - Low Frequency
MBES - Multibeam Echosounder
MGL - RV Marcus G. Langseth
MMPA - Marine Mammal Protection Act
NMFS - National Marine Fisheries Service
NRP - Navigation Reference Point
NSF - National Science Foundation
PI - Principal Investigator
PTS - Permanent threshold shift
PSO - Protected Species Observer
RME - PAM sound card manufacturer company name (not an acronym)
RMS - Root mean square
RPS - PSO Provider company name (not an acronym)
RV - Research vessel
SBP - Sub-bottom Profiler
TOAD - Time of Arrival Distance
TTS - Temporary Threshold Shift
TVG - Transverse Gradiometer
US - United States
UTC - Coordinated Universal Time
VSA - Vessel Strike Avoidance

## 1 EXECUTIVE SUMMARY

The R/V Marcus G. Langseth (MGL), which is owned and operated by Columbia University's LamontDoherty Earth Observatory (LDEO), conducted a high-energy 2D seismic survey in the Northwest Atlantic Ocean off the coast of North Carolina from 09 May to 03 June 2023 (referred to herein as "survey"). The operational activities were conducted in support of research proposed by Principal Investigators (PIs) Drs. H. Daigle (University of Texas at Austin), A. Becel and C. Grall (L-DEO) and funded by the National Science Foundation (NSF).
The purpose of the survey was to collect low energy 2D seismic reflection data to study geological processes at the Cape Fear submarine slide complex, where submarine landslides are a common seafloor feature and have been associated with tsunamis in the past.

This report was prepared to meet the reporting requirements for the survey required under the Marine Mammal Protection Act (MMPA) and Endangered Species Act (ESA). On 12 October 2022, NSF applied to the US National Marine Fisheries Service (NMFS) for an Incidental Harassment Authorization (IHA) that would allow for the potential harassment of small numbers of protected marine mammals incidental during the seismic survey. On 05 May 2023, NMFS issued the signed Biological Opinion (BiOp) and IHA for the survey.

Mitigation measures were implemented to minimize potential impacts to marine mammals and protected species. These measures included, but were not limited to, the use of NMFS approved Protected Species Observers (PSOs) for visual and acoustic monitoring, the designation of buffer zones (BZ) and exclusion zones (EZ) (where the presence of a protected species would require a mitigation action), and the implementation of ramp-up procedures, mitigation actions (including delayed operations and shutdowns), and vessel strike avoidance (VSA) maneuvers. Continuous protected species observation coverage during the survey was provided by RPS, the PSO provider contracted for the survey. PSOs monitored and reported on the presence and behavior of protected species and directed the implementation of the mitigation measures, as described in the regulatory documents issued for the survey.
A team of five PSOs, one of which was designated as the Lead, were present on board MGL throughout the survey to conduct visual and acoustic monitoring. Throughout the survey, PSOs conducted visual monitoring for a total of 372 hours and 40 minutes and acoustic monitoring for a total of 518 hours and 50 minutes. Visual and acoustic monitoring were conducted simultaneously for a total of 327 hours and 15 minutes. The acoustic survey source was active for a total of 497 hours and 44 minutes.
There was a total of three visual detections of protected species during the survey. Visual detections included two detections of dolphins (one sighting of bottlenose dolphins and one sighting of unidentified dolphins, and one detection of an unidentified sea turtle.
There was a total of one acoustic detection of protected species during the survey. The acoustic detection was of unidentified dolphins.
Protected species detections resulted in the implementation of one mitigation action during the survey, consisting of one shutdown for an unidentified sea turtle for a total of 16 minutes. There were no VSA maneuvers implemented for, in which would have required the vessel to reduce speed and/or alter course.

NMFS issued an IHA, authorizing 5909 Level B takes for 26 species of marine mammals, including four species that are listed as endangered. There were 31 Level A takes authorized for one species group of marine mammals. For this report, the definition of Level $A$ and Level $B$ are the same as found in the MMPA and the NMFS issued BiOp regarding what constitutes a take. There were 1302 Level B takes issued for four ESA-listed sea turtle species and no specific number of takes issued for ESA-listed seabird species for this survey.
During the survey program, two unidentified dolphins and one unidentified sea turtle, were observed within the predicted 160 decibel radius (where there is a potential for a behavioral response and temporary threshold shift (TTS)) while the acoustic source was active, constituting potential Level B takes. There were no protected species observed within the predicted radius at which there is a potential for auditory injury (based upon each species hearing range and how that overlaps with the frequencies produced by the sound source), constituting potential Level A takes/exposures.

## 2 INTRODUCTION

The following report details protected species monitoring and mitigation as well as seismic survey operations undertaken as part of the high-energy 2D marine geophysical survey on board the R/V Marcus G. Langseth (MGL) in the Northwest Atlantic Ocean, off the coast of North Carolina from 09 May to 03 June 2023.
This document serves to meet the reporting requirements dictated in the IHA issued to NSF by NMFS on 05 May 2023. The IHA authorized takes of specific protected species incidental to the survey. NMFS has stated that seismic source received sound levels equal to or greater than 160 dB re $1 \mu \mathrm{~Pa}$ root mean square (rms) ( 160 dB ) could potentially disturb marine mammals, temporarily disrupting behavior, such that they could be considered non-lethal 'takes' (Level B harassment). In July 2016, NMFS released new technical guidance for assessing the effects of anthropogenic sound on marine mammal hearing, which established new thresholds for permanent threshold shift (PTS) onset, Level A harassment (auditory injury), for marine mammal species. Predicted distances to Level A harassment vary based on species specific hearing groups - low frequency cetaceans, mid frequency cetaceans, high frequency (HF) cetaceans, phocid pinnipeds, otariid pinnipeds, sea otters, and sea turtles - and how each group's hearing range overlaps with the frequencies produced by the sound source.

NMFS requires that measures such as buffer zones (BZs), exclusion zones (EZs), delayed operations, ramp-ups, and shutdowns be implemented to mitigate for potentially adverse effects of the acoustic source sounds on protected species. The BZs and EZs were established from any element on the acoustic source array as areas, where the presence of a protected species would require the implementation of a mitigation action (see Section 6). For marine mammals, the occurrence of an individual detected approaching, entering, or within their designated EZ would require the implementation of a shutdown of the seismic source. NMFS specified a 500 meter EZ for most marine mammals as it encompasses all zones within which auditory injury (Level A harassment) could occur on the basis of instantaneous exposure, provides additional protection from the potential for more severe behavioral reactions for marine mammals at relatively close range to the acoustic source, provides a consistent area for PSOs to conduct effective observational effort, and is a distance within which detection probabilities are reasonably high for most species under typical conditions.
In accordance with the IHA, the PSO team conducted an onboard environmental management briefing with the vessel personnel prior to the start of source operations. The lead PSO covered the mitigation and monitoring protocols, communication procedures, roles and responsibilities of the monitoring team and any additional operational procedures for this survey.
The IHA is attached as Appendix A.

### 2.1 Project Overview and Location

The research activities involved a 2D high-energy seismic survey. The research activities took place within the Northwest Atlantic Ocean, off the coast of North Carolina, in water depths of approximately 300 to 5200 meters (Figure 1).
The purpose of the research was to collect 2D seismic reflection data to understand the Cape Fear submarine landslide and provide new constraints for examining the associated tsunami hazards. The survey will provide further understanding of how slope failures operated through time and the manner in which past sub-marine landslides might affect succeeding events. Also, a regional grid of seismic data with companion multi-beam echosounder and sub-bottom profiler data were needed to place the existing and new observations within a regional stratigraphic framework.
All operations for the survey were conducted solely by MGL. The vessel is 72 meters ( 236.2 feet) in length and has a beam of 17 meters ( 55.8 feet) and a maximum draft of 5.9 meters ( 19.4 feet). The vessel's cruising speed was approximately 10 knots, during transits and varied between three and five knots during the seismic survey.

Figure 1: Location and survey points of the 2D seismic survey.
Seismic Operations were conducted between 11 May and 02 June 2023. There was a total of 59 survey line sequences acquired during the operational period.

### 2.1.1 Energy Source and Receiving Systems

The energy source utilized during the survey consisted of two towed acoustic source sub-arrays towed aft of the vessel, each with nine source elements, for a total of 18 source elements, a total volume of 3300 cubic inches. The source array utilized Bolt 1500LL and Bolt 1900LLX elements ranging in size from 40 to 360 cubic inches. The operating pressure was 2000 pounds per square inch and the dominant frequency components ranged from two to $188 \mathrm{Hertz}(\mathrm{Hz})$. The shot point interval was 25 meters ( 10.6 seconds) dependent on vessel speed which ranged from 3 to 5.5 knots during acquisition. During acquisition, the source elements emitted a brief (approximately 0.1 second) pulse of sound. The source elements were towed at a depth of six meters. The center of the source was 304 meters from the Navigation Reference Point (NRP), which was located 29 meters from the stern of the vessel. This positioned the elements on the array 275 meters from the stern of the vessel.

The receiving system for the seismic survey consisted of one 6000-meter hydrophone streamer with 552 channels, which received the returning acoustic signals and transferred the data to the onboard processing system
Additional sound sources used in support of research efforts included a Kongsberg EM 122 multi-beam echosounder (MBES), Knudsen Chirp 3260 sub-bottom profiler (SBP), and a Teledyne RDI 75 kHz Ocean Surveyor acoustic doppler current profiler (ADCP). The hull mounted MBES operated at frequencies between 10.5 and 13 (usually 12) kilohertz. Each ping consisted of eight (in water depths
greater than 1000 meters) or four (in water depths less than 1000 meters) successive fan-shaped transmissions. The transmitting beam width was one or two degrees fore-aft and 150 degrees perpendicular to the ship's line of travel. The maximum source level was 242 dB re: $1 \mu \mathrm{~Pa}$ (root mean square [rms]). The hull-mounted SBP beam was transmitted as a 27 -degree cone, which was directed downward by a 3.5 kilohertz transducer. The nominal power output was 10 kilowatts; however, the actual maximum radiated power was three kilowatts or 222 dB re: $1 \mu \mathrm{Pam}(\mathrm{rms})$. The ping duration was 64 seconds, and the interval was one second. The hull-mounted ADCP operated at a frequency of 75 kilohertz and a maximum source level of 224 dB re: $1 \mu \mathrm{Pam}(\mathrm{rms})$ over a conically shaped 30 -degree beam. The MBES and SBP operated simultaneously to provide information about near seafloor sedimentary features and to map the topography of the ocean floor. The ADCP was used to measure water current velocities.

## 3 MITIGATION AND MONITORING METHODS

The PSO monitoring program on the MGL was established to meet the standards set forth in the IHA and BiOp requirements. Survey mitigation measures were designed to minimize potential impacts of the MGL's seismic activities on marine mammals and other protected species of interest. The following monitoring protocols were implemented to meet these objectives.
$\square \quad$ Visual observations were conducted to provide real-time sighting data, allowing for the implementation of mitigation procedures as necessary.
$\square \quad$ A passive acoustic monitoring (PAM) system was operated 24 hours a day during seismic source operations to augment visual observations and provide additional marine mammal detection data.
$\square \quad$ Effects of marine species exposed to sound levels constituting a defined take were observed and documented. The nature of the probable consequences was discussed when possible.

In addition to the mitigation objectives outlined in the project permit documents, PSOs collected and analyzed necessary data mandated by the IHA.

### 3.1 Mitigation Methodology

Mitigation actions were implemented for visual and acoustic detections of protected species, including marine mammals, as outlined in the IHA and BiOp. These actions included the establishment of buffer zones (BZs) and exclusion zones (EZs), and the implementation of delayed operations and shutdowns (where the seismic source was fully silenced) for protected species detected approaching, entering, or within their designated BZ and EZ (Table 1).
Before the acoustic source could be activated from silence, two visual PSOs and one PAM (Passive Acoustic Monitor) operator conducted a 30-minute clearance period of the BZs and EZs. In the event of a detection of protected species within their designated zones (Table 2) or as outlined in Table 1, a delay of source activation operations would be implemented. Source operations would not be cleared to begin until the protected species were observed exiting their designated zones. If the protected species were not observed exiting their designated zones (i.e., if they dove/submerged within the zone and were not resighted), operations would not be cleared to begin until a specific time following the final detection of the animals. For detections of small odontocetes and pinnipeds, this time was 15 minutes following last sighting. For detections of sea turtles or ESA listed sea birds, operations could resume without a ramp-up 15 minutes following the last sighting. For detections of mysticetes and other large odontocetes (including sperm whales or beaked whales), this time was 30 minutes following last sighting.

Table 1: Specific detections of protected species and their required mitigation actions.

## Detection of:

## Mitigation Action Required

A large whale (defined as a sperm whale or any mysticete species) with a calf (defined as an animal less than two-thirds the body size of an adult and observed in close association with an adult) observed at 1500 meters from the vessel.
An aggregation of six or more large whales observed at 1500 meters from the vessel.
Any North Atlantic right whale observed at any distance from the vessel.
Any marine mammal species not authorized for take observed approaching, entering, or within the 160decibel radius.
Any marine mammal species for which the total authorized takes has been met observed approaching entering, or within the 160-decibel radius.

Delayed operation of inactive source and shutdown of active source.

Delayed operation of inactive source and shutdown of active source. Delayed operation of inactive source and shutdown of active source.
Delayed operation of inactive source and shutdown of active source.

Delayed operation of inactive source and shutdown of active source.

Any sea turtle species detected approaching, entering, or within their designated exclusion zones, and any Delayed operation of inactive source and ESA-listed sea bird species detected diving and/or foraging within their designated exclusion zones. Any dolphin species with a shut-down exemption detected approaching, entering, or within their shutdown of active source. designated exclusion zones.

Table 2: Separation distances, buffer and exclusion zones sizes for each species / species group expected to occur in the survey area.

| Species/Species Groups | Separation <br> Distance (meters) | Buffer Zones <br> (meters) | Exclusion Zones <br> (meters) | Delay Duration <br> (minutes) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Large whale/calf, 6+ large <br> whales | 100 | 1500 | 1500 | 30 |
| Beaked whales, dwarf, and <br> pygmy sperm whales | 100 | 1500 | 1500 | 30 |
| North Atlantic right whales | 500 | Any distance | Any distance | 30 |
| Mysticetes and large <br> odontocetes | 100 | 1000 | 500 | 30 |
| All other small dolphins and <br> porpoises | 50 | 1000 | $500^{1}$ | 15 |
| Pinnipeds | 50 | 200 | 100 | 15 |
| Sea turtles | 100 | 175 dB radius | 150 | 15 |
| ESA listed sea birds | none | none | 150 | 15 |

1 Except exempt species per the NMFS IHA
Once the acoustic source was active, the BZ from any element on the acoustic source arrays were established as areas in which the presence of a protected species would initiate an alert to the seismic operators that the animal was detected, and that the implementation of a mitigation action may soon be required. PSOs and PAM operators would keep in frequent contact with each other and the seismic team, relaying information on the location and movement of the protected species, and the implementation of any needed mitigation actions.
The EZs from any active source element were established as areas in which the detection of a protected species would require a shutdown of the seismic source, depending on the species present. For marine mammals, the detection of one approaching, entering, or within their designated zone would require a shutdown of the source. For sea turtles, the detection of one approaching within their designated zone would require a shutdown of the source. For protected sea birds, the detection of one foraging or diving within their designated zone would require a shutdown of the source.

Upon the implementation of a shutdown for a detection of protected species, a ramp-up was required to resume source activity once the protected species were confirmed to have exited their respective exclusion zones. If the protected species could not be confirmed to have exited their respective exclusion zones (i.e., if they submerged/dove within the zone and were not re-sighted), clearance for ramp-up would not be given until a specific time following the last sighting of the individuals within the zones. For detections of small odontocetes or pinnipeds, this time was 15 minutes following last sighting. For detections of mysticetes and other large odontocetes (including sperm whales or beaked whales) this time was 30 minutes following last sighting. For detections of sea turtles or ESA listed sea birds source activity could resume without a ramp-up 15 minutes following the last sighting.

The IHA also outlined additional mitigation actions for specific protected species while the acoustic source was active as outlined in Table 1.

Specific acoustic source operation procedures outlined in the IHA that were relevant to this specific survey included:

1. Ramp-ups could not be less than 20 minutes and were required to begin with the smallest volume element and continue in stages by doubling the number of active elements, with each stage approximately the same duration. The time between ramp-up completion and start of data acquisition had to be minimized.
2. Testing of individual elements or strings required a 30-minute clearance search period but no ramp-up. Testing of more than one element or string required both a 30-minute clearance search period and a ramp-up to the maximum volume being tested.
3. Brief periods (less than 30 minutes) of operational silence for reasons other than a protected species shut-down did not require a ramp-up to resume full volume source operations provided that: (1) PSOs maintained constant visual observation, and (2) no detections of protected species occurred within the applicable exclusion zone during that silent period. For any brief period of silence at night or in periods of poor visibility (e.g., BSS of four or greater), a ramp-up was required, but if constant observation was maintained, a pre-start clearance watch was not required. For any longer shutdown, both a pre-start clearance watch by a visual PSO and PAM operator and a ramp-up were required.

Table 3 describes the predicted 160 decibel radius (Level B harassment zone for marine mammals) and the predicted 175 decibel radius (Level B harassment zone for sea turtles) where the predicted distance for the source was used.

Table 3: Predicted 160 and 175 decibel zones* implemented during the survey.

| Source | Volume $\left(\mathrm{in}^{3}\right)$ | Water Depth (m) | 160 dB radius ( m ) - Level $B$ harassment zone for marine mammals | 175 dB radius (m) - Level $B$ harassment zone for sea turtles |
| :---: | :---: | :---: | :---: | :---: |
| $\overline{18}$ <br> elements | 3300 | > 1000 | 2886 | 609 |
| $18$ <br> elements | 3300 | 100-1000 | 4329 | 909 |
| *Distances are from any single element on the array |  |  |  |  |

### 3.2 Visual Monitoring Survey Methodology

There were five experienced PSOs on board the MGL during the seismic survey to conduct monitoring for protected species, record and report detections, and request mitigation actions in accordance with the IHA and BiOp. The PSOs on board were NMFS approved and held certifications from a recognized Bureau of Ocean Energy Management (BOEM) PSO course. The PSOs that were onboard the MGL are listed in Appendix B. Visual monitoring was primarily carried out from an observation tower (Figure 2) located 18.9 meters above the surface of the water, which allowed a 360-degree viewpoint around the vessel and acoustic source.

Figure 2: Protected Species Observer stern view of observation tower with mounted big-eye binoculars.
The PSO tower was equipped with Fujinon $7 \times 50$ and Steiner Marine $7 \times 50$ binoculars, as well as two mounted $25 \times 150$ Big-eye binoculars for visual monitoring. A D-300-2MS Night Optics USA, Inc. monocular and two Butler Creek PVS-7-night vision devices were also available for visual monitoring during reduced/restricted lighting conditions if needed. Inside the tarpaulin tent the PSOs were provided a laptop, a telephone for communication with the PAM station, bridge, and main lab, and a monitor that displayed pertinent information about the vessel including position; speed; heading; water depth; sea temperature, wind speed and direction, and air temperature. The monitor also displayed source activity information including survey line number, total number of active elements and volume. Environmental conditions along with vessel and acoustic source activity were recorded at least once an hour, and every time there was a change in one or more of the above variables. Most visual monitoring was held from the tower; however, during severe weather or when the ships exhaust was blowing on the tower, monitoring would be conducted from the bridge (approximately 12.8 meters above sea level) or the catwalk (approximately 12.3 meters above sea level). Visual monitoring methods were implemented in accordance with the survey requirements outlined in the IHA. A minimum of two PSOs were required to be on duty and always conducting monitoring during daylight hours, from when the vessel departed port to when the vessel returned to port. Visual monitoring during the transits between ports and survey area were conducted for VSA and to gather baseline data on the presence and abundance of protected species in the areas during periods of acoustic source silence. Scheduled watches were a maximum of four hours followed by at least one hour of scheduled break time.
Visual observations were conducted around the entire area of the vessel and acoustic source, divided between the two PSOs on watch. The smaller monitoring area for each observer increased the probability of protected species being sighted. PSOs searched for blows, fins, splashes or disturbances of the sea surface, large flocks of feeding sea birds, and other sighting cues indicating the possible presence of a protected species. Upon the visual detection of a protected species, PSOs would identify the animals' range to the vessel and acoustic source. Range estimations were made using reticle binoculars, the naked eye, and by relating the animal(s) to an object at a known distance, such as the acoustic source arrays and streamer head float. PSOs would also identify to species, if possible, upon initial detection to ensure that the proper mitigation measures were implemented, should any be required.

As required by the IHA (section 5(d)(iii)), PSOs recorded the following information for each protected species detection:
I. Date, time of first and last sighting, observers on duty during the detection, location of the observers, vessel information (e.g., position, speed, heading), water depth, and acoustic source activity (e.g., volume and number of active elements).
II. Species, detection cue, group size (including number of adults, juveniles, and calves), visual description (e.g., overall size, shape of the head, position and shape of the dorsal fin, shape of the flukes, height, and direction of the blow), observed behaviors (e.g., porpoising, logging,
diving, etc.), and the initial and final pace, heading, bearing, and direction of travel in relation to both the vessel and the source (e.g., towards, away, parallel, perpendicular, etc.).
III. Initial, closest, and final distance to the vessel and the source, time when entering and exiting the exclusion zones, type of mitigation action implemented, total time of the mitigation action, description of other vessels in the area, and any avoidance maneuvers conducted.

During or immediately after each sighting event, the PSOs recorded the detection details per the requirements of the IHA in a detection datasheet. Each sighting event was linked to an entry on an effort datasheet where specific environmental conditions (e.g., Beaufort Sea state, wind force, swell height, visibility, and glare) and vessel activity were logged.

Species identifications were made whenever the distance from the observer, length of the sighting, and visual observation conditions allowed. Whenever possible during detections, photographs were taken with Canon EOS 80D cameras that had 300-millimeter lenses. Marine mammal identification manuals (Whales, Dolphins, and Other Marine Mammal of the World; Guide to Marine Mammals of the world; Readers Digest Whales, Dolphins, and Porpoises; Seabirds of the world; Sibley Guide to Birds) were consulted, and photos were examined to confirm identifications were consulted, and photos were examined to confirm identifications.

### 3.3 Passive Acoustic Monitoring Methodology

Passive Acoustic Monitoring (PAM) was used to augment visual monitoring efforts in the detection, identification, and locating of marine mammals. PAM is important during periods of time when visual monitoring was not effective (periods of darkness or low visibility). Acoustic monitoring was conducted continuously during all seismic operations and to the maximum extent possible during periods of acoustic source silence. When the acoustic source was activated from any period of silence, acoustic monitoring was conducted for at least 30 minutes prior to the activation of the source for the pre-clearance survey. PAM shifts were a maximum of four hours in duration followed by at least one hour of scheduled break time.

In accordance with the NMFS issued IHA and ITS, in the event of an issue with PAM equipment, acoustic source activity could continue for 30 minutes without acoustic monitoring while the PAM operator diagnosed the issue. If the diagnosis indicated that the PAM system needed maintenance, operations could continue for an additional five hours without acoustic monitoring, during daylight hours only, provided that: (1) the sea state was less than or equal to a BSS 4; (2) with the exception of delphinids, no marine mammals were acoustically detected in the applicable exclusion zones in the previous two hours; (3) active acoustic source operations without acoustic monitoring did not exceed a cumulative total of five hours within any 24 hour period; and (4) NMFS was notified via email as soon as practicable of the time and location in which operations occurred without an active PAM system.
The PAM system was located in the main science lab which allowed ample space, quick communication with the PSOs and seismic technicians, and access to the vessel's instrumentation screens. Information about the vessel (e.g., position, heading, and speed), water depth, source activity (e.g., line number, total source volume, number of active elements), and the PAM system (e.g., cable deployments/retrievals, changes to the system, background noise score, hydrophone depth) were recorded at least once an hour, and whenever any of the parameters changed.
Acoustic monitoring for marine mammals was conducted aurally, utilizing Sennheiser headphones, and visually with the PAMGuard software program. Low frequency (LF) to mid-frequency delphinid whistles, clicks, and burst pulses, as well as sperm whale clicks and baleen whale vocalizations, could be visualized in PAMGuard's spectrogram modules. Sperm whale, beaked whale, Kogia species, and delphinid clicks could also be visualized in LF and HF click detector modules. Settings adjustments to amplitude range, amplitude triggers, and spectral content filters, among others, could be made in PAMGuard's spectrogram and click detector modules to maximize the distinction between cetacean vocalizations and ambient signal. The map module within PAMGuard could be utilized to attempt localizing the position and range of vocalizing marine mammals. Sound recordings could be made using the HF and LF sound recording modules when potential marine mammal vocalizations were detected, or when the operator noted unknown or unusual sound sources.

221339 | Marcus G Langseth Protected Species Mitigation and Monitoring Report | Final | August 02, 2023 |

As required by the IHA (section 5(d)(iv)), PAM operators recorded the following information during acoustic detections of protected species:
I. An acoustic encounter identification number, and whether the detection was linked with a visual sighting;
II. Date and time when first and last heard;
III. Types and nature of sounds heard (e.g., clicks, whistles, creaks, burst pulses, continuous, sporadic, strength of signal);
IV. Any additional information recorded such as water depth of the hydrophone array, bearing of the animal to the vessel (if determinable), species or taxonomic group (if determinable), spectrogram screenshot, and any other notable information.

### 3.3.1 Passive Acoustic Monitoring Parameters

A PAM system designed to detect most species of marine mammals was installed on board the MGL. The system was developed by Seiche Measurements Limited and consisted of the following main components: a 255 meter hydrophone cable (configured as a separate 230 meter steel-reinforced tow cable and detachable 25 meter hydrophone array); a 100 meter deck cable; a rack-mounted electronic processing unit (EPU) that incorporated a buffer unit, RME Fireface 800 unit and computer; two desktop monitors; a keyboard and mouse; acoustic analysis software package; and headphones for aural monitoring. A complete spare system of all components was also present on board in the event that any of the main system components became damaged or inoperable. The diagram in Figure 3 is a simplified depiction of the PAM system installed on the MGL, and further PAM system specifications can be found in Appendix D.
The hydrophone cable contained six hydrophone elements and a depth gauge molded into a 25 -meter section of the cable. The six-element linear hydrophone array allowed the system to sample a large range of marine mammal vocalization frequencies. The hydrophone pair closest to the end by the depth gauge were used for low frequencies between 10 hertz and 24 hertz, the middle hydrophone pair was used for mid frequencies between 200 hertz and 200 kilohertz, and the forward hydrophone pair closest to the connector to the tow cable was used for high frequencies between two kilohertz and 200 kilohertz.

Figure 3: Simplified pathway of data through the PAM system onboard the MGL
The deck cable interfaced between the hydrophone cable deployed astern of the vessel and the electronics processing unit (EPU) located in the main science lab. The rack-mounted EPU was set up with the two pre-installed, wall-mounted monitors supplied by the Langseth, a keyboard, a mouse, and headphones. The EPU contained a buffer unit with Universal Serial Base (USB) output, an RME Fireface

800 ADC unit with firewire output, and a rack-mounted computer. A Global Positioning System (GPS) feed of GNGGA strings was supplied from the ship's Seapath navigation system and routed to the computer, reading data every five seconds. Data from the hydrophone cable's depth transducer was routed through the buffer unit to the computer, via USB connection. PAMGuard Beta version 1.15 .11 was the software version utilized for the survey until 22 May 2022, at which time version 1.15 .17 was installed and utilized for the remainder of the survey.
Raw feed from the two high frequency hydrophone elements was digitized in the buffer unit using an analogue-digital National Instruments data acquisition (DAQ) soundcard at a sampling rate of 500 kilohertz. The output was filtered for HF content and visualized using the PAMGuard software, which used the difference between the time that a signal arrived at each of the two hydrophones to calculate and display the bearing to the source of the signal. A scrolling bearing/time module displayed the filtered data in real time, allowing for the detection and directional mapping of click trains. Additional components of the HF click detector system in PAMGuard included: an amplitude/time display that registered click intensity data in real time, as well as click waveform, click spectrum, and Wigner plot displays, providing the PAM operator immediate review of individual click characteristics in the identification process.

Raw feed from the two low frequency and two mid frequency hydrophone elements was routed from the buffer unit to the RME Fireface 800 unit, where it was digitized at a sampling rate of 48 kilohertz. The relatively low frequency (LF) output was further processed within PAMGuard by applying Engine Noise Fast Fourier Transform (FFT) filters, including click suppression and spectral noise removal filters (e.g., median filter, average subtraction, Gaussian kernel smoothing and thresholding). Filtered LF content was visualized in two spectrograms, one displaying a channel feed at frequency ranges of zero to 24 kilohertz, and another displaying a channel feed at a frequency range of zero to three kilohertz. LF click detector modules allowed for review of individual click characteristics as well as the detection and tracking of click trains.

A map module on the LF system interfaced with GPS data provided by the vessel to display the vessel location and could be used to determine range and bearing estimates based on clicks tracked in the click detector module. PAMGuard contained a function for calculating the range to vocalizing marine mammals based upon the least squares fit test. This method is most effective with animals that are relatively stationary in comparison to the moving vessel, such as sperm whales. The mathematical function estimated the range to vocalizing marine mammals by calculating the most likely crossing of a series of bearing lines generated from tracked clicks or whistles and plotted on a map display. The bearings of detected whistles and moans were calculated using a Time-of-Arrival-Distance (TOAD) method (where the signal time delay between the arrival of a signal on each hydrophone was compared), and presented on a radar display, along with amplitude information for the detected signal as a proxy for range.

Additional modules displayed on the LF monitor included a LF sound recorder and clip generator. The clip generator module within PAMGuard could be used to generate short sound clips in response to either an automatic detection or the operator manually selecting a portion of the spectrogram display. This module was useful in the event that the whistle-and-moan detector falsely triggered and identified a non-biological sound (i.e., echosounder) or if it missed detecting tonal signatures that the operator determined to be vocalizations.

### 3.3.2 Hydrophone Deployment

The hydrophone cable was deployed from a hydraulic winch on the port stern of the vessel's aft deck where the acoustic source arrays were deployed. Two deck cables, a main and a spare, were installed along the deck-head running from the winch to the main science lab. A Chinese finger attached to the tow cable approximately 125 meters ahead of the connector to the hydrophone array was secured to the port side boom via lifting rope. This reduced the tension on the cable remaining on the winch and served as a method to pull the cable further to port and away from the source arrays. This deployment method placed the trailing end of the hydrophone cable approximately 125 meters from the port stern of the vessel (Figure 4). One piece of chain of seven kilograms was attached and secured to the tow cable to increase tow depth and to decrease the chance of entanglement with the source arrays' umbilicals. The tow depth of the hydrophones varied between 12.7 and 23 meters and averaged 15.3 meters throughout the seismic survey.

Figure 4. Location of the PAM cable in relation to the seismic gear during the survey.

## 4 MONITORING EFFORT SUMMARY

### 4.1 Survey Operations Summary

### 4.1.1 General Survey Parameters

The Cape Fear seismic survey began on 09 May 2023, when the MGL departed port in Norfolk, Virginia. Seismic data acquisition operations were conducted between 11 May and 02 June. The survey concluded on 03 June 2023, when the vessel arrived back at port in Morehead, North Carolina (Table 4).
Table 4: Survey parameters.

| Survey Parameter | Date | Time (UTC) | Location |
| :--- | :--- | :--- | :--- |
| Mobilization | 09 May 2023 | $17: 15$ | Norfolk, Virginia |
| First seismic source activity | 11 May 2023 | $09: 03$ | Survey area |
| Start of acquisition | 11 May 2023 | $09: 59$ | Survey area |
| End of acquisition | 02 June 2023 | $14: 00$ | Survey area |
| Transit to Morehead | 02 June 2023 | $23: 37$ | Survey area |
| Arrive in Morehead | 03 June 2023 | $13: 00$ | Morehead, North Carolina |

During the seismic survey, data was acquired continuously according to the survey plan, with source operations only suspended when there were mechanical or technical issues.

Table 5: Suspension of source operations during the survey.

|  | Time <br> Source <br> Silenced | Date | Time Source <br> Re-activated | Reason for Interruption to Acquisition |
| :--- | :--- | :--- | :--- | :--- |
| 19 May 2023 | $19: 59$ | 20 May 2023 | $12: 26$ | Stop acquisition for mechanical issues |
| 26 May 2023 | $16: 10$ | 27 May 2023 | $02: 16$ | Stop acquisition for mechanical issues |

### 4.1.2 MBES, SBP, and ADCP Operations

The multi-beam echosounder (MBES), sub-bottom profiler (SBP), and the Acoustic Doppler current profiler (ADCP) systems were active throughout the survey for a total of 1753 hours 28 minutes. The SBP was active for the first time on 09 May 2023 at 20:18 UTC. The ADCP was active for the first time on 09 May at 21:30 UTC. The MBES was active for the first time on 09 May at 21:30 UTC. All the sound sources were active during transit and throughout the survey. The ADCP, SBP, and MBES were all disabled on 03 June at 07:18 UTC. All three sound sources were disabled and re-enabled multiple times throughout the survey, mainly for technical issues.

### 4.1.3 Acoustic Source Operations

The acoustic source was active for a total of 497 hours and 44 minutes throughout the survey. This total included: two hours and 58 minutes of ramp-up, 425 hours and 44 minutes of operations on a survey line at full volume, 55 hours and 33 minutes at reduced volume on a survey line, 11 hours and 17 minutes of operations not on a survey line at full volume, two hours and six minutes at reduced volume not on a survey line and six minutes of source testing.
Table 6 summarizes the acoustic source operations over the course of the seismic survey.
The acoustic source was ramped up eight times during the survey to commence data acquisition. seven ramp-ups were cleared by visual and acoustic monitoring while one was cleared solely by acoustic monitoring for a brief technical silence at night (less than 30 minutes). Four ramp-ups occurred at night and four ramp-ups occurred during the day. The duration of all ramp-ups was between 21 and 23 minutes.

There was one occasion of source testing. It consisted of a multi-source test at the end of a survey line.

Table 6: Total acoustic source operations during the survey.

|  |  |  |
| :--- | :--- | :--- | :--- |
| Source Tests | 1 | $00: 06$ |
| Ramp-up | 8 | $02: 58$ |
| Day-time ramp-ups | 4 | $01: 29$ |
| Night-time ramp-ups | 4 | $01: 29$ |
| Full $\left(\mathbf{3 3 0 0}\right.$ in $\left.^{3}\right) /$ Reduced Volume on a Survey Line |  | $425: 44 / 55: 33$ |
| Full $\left(\mathbf{3 3 0 0}\right.$ in $^{3}$ )/Reduced Volume not on a Survey Line |  | $11: 17 / 02: 06$ |

The geospatial data for source operations are provided as a shapefile attachment to this report.
The monitoring effort, source operations and protected species detections for this survey are provided as an excel dataset in Appendix C and the basic data summary form found in Appendix D .

### 4.1.4 Interactions with Other Vessels

In addition to visually monitoring for protected species, PSOs also observed and documented interactions with other marine vessel traffic. Such interactions included but were not limited to another vessel or another vessels' towed gear/equipment interacting with the MGL's towed gear/equipment, and the MGL having to deviate from planned survey operations (i.e., diverge from the survey line, increase/decrease speed) because of another vessel.
There were no instances where the MGL had such an interaction with another vessel during the survey.

### 4.2 Visual Monitoring Survey Summary

Visual monitoring was conducted by two PSOs during all daylight hours, beginning 30 minutes before sunrise and ending 30 minutes after sunset each day, initiating when the vessel left dock at the beginning of the program and terminating upon the vessels return to dock at the end of the program (Table 7). During transit, observations were undertaken by two PSOs for VSA and visual monitoring during times with no source operations was conducted to collect baseline data about protected species abundance in the survey areas.
Table 7: Initiation and termination of visual monitoring during the survey.

| Initiation for the survey | 09 May 2023 | $17: 15$ |
| :--- | :--- | :--- |
| Termination for the survey | 03 June 2023 | $13: 00$ |

Visual monitoring on the MGL was conducted over a period of 26 days for a total of 372 hours and 40 minutes. Of the overall total visual monitoring effort, $84 \%$ ( 313 hours and 25 minutes) was undertaken while the acoustic source was active, and 16\% (59 hours and 15 minutes) was undertaken while the acoustic source was silent. Visual monitoring while the acoustic source was silent was mainly conducted during the transits. Table 8 details visual monitoring with acoustic source operations on the MGL throughout the seismic survey.

Table 8: Total visual monitoring effort during the survey.

| Visual Monitoring Effort | Duration (hh:mm) | \% of Overall Effort |
| :--- | :--- | :--- |
| Total monitoring while acoustic source active | $313: 25$ | 84 |
| Total monitoring while acoustic source silent | $59: 15$ | 16 |
| Total monitoring effort | $372: 40$ | - |

### 4.3 Acoustic Monitoring Survey Summary

Acoustic monitoring was conducted continuously throughout acoustic source operations and to the maximum extent possible while the acoustic source was silent (Table 9). Periods without source activity or acoustic monitoring occurred when the PAM hydrophone cable was secured on board the vessel during transits, during deployment and recovery of the seismic gear, and during times when operations were suspended due to rough weather and sea conditions or gear maintenance.

Table 9: Initiation and termination of acoustic monitoring watches during survey.

| Acoustic Monitoring | Date | Time (UTC) |
| :--- | :--- | :--- |
| Initiation for the survey | 11 May 2023 | $04: 50$ |
| Termination for the survey | 02 June 2023 | 15:25 |

Acoustic monitoring was conducted on 23 days for a total of 518 hours and 50 minutes. Of the overall total acoustic monitoring effort, $96 \%$ ( 497 hours and 44 minutes) was undertaken while the acoustic source was active, and $4 \%$ ( 21 hours and six minutes) was undertaken while the acoustic source was silent. Acoustic monitoring while the acoustic source was silent was mainly conducted during the brief periods of time between recovery/deployment of the seismic gear and recovery/deployment of the PAM cable. Table 10 details acoustic monitoring with acoustic source operations.

Table 10: Total Passive Acoustic Monitoring (PAM) effort during the survey.

| Acoustic Monitoring Effort | Duration (hh:mm) | $\%$ of Overall Effort |
| :--- | :--- | :--- |
| Total monitoring while the acoustic source was active | $497: 44$ | 96 |
| Total monitoring while the acoustic source was silent | $21: 06$ | 04 |
| Total acoustic monitoring | $\mathbf{5 1 8 : 5 0}$ |  |

### 4.4 Simultaneous Visual and Acoustic Monitoring Summary

Simultaneous visual and acoustic monitoring was conducted to the maximum extent possible for a total of 327 hours and 15 minutes. Of the overall simultaneous monitoring effort, $96 \%$ ( 313 hours and 25 minutes) was conducted while the acoustic source was active (Table 11). Additional visual monitoring conducted during transit periods was not accompanied by acoustic monitoring as the increased vessel speed would causes the hydrophone cable to migrate to the water surface, out of the ideal tow position, where increased background noise would impair acoustic detection capabilities.

Table 11: Simultaneous visual and acoustic monitoring effort during the survey.
Simultaneous Visual and Acoustic Monitoring Duration (hh:mm) \% of Overall Downtime

| Source Active | $313: 25$ | 96 |
| :--- | :--- | :--- |
| Source Silent | $13: 50$ | 04 |
| Overall Total | $\mathbf{3 2 7 : 1 5}$ |  |

### 4.5 Environmental Conditions

Environmental conditions can have an impact on the probability of detecting protected species. The environmental conditions present during visual observations undertaken during the survey program were generally considered to be 'excellent.'
Visibility was classified as 'excellent' if it extended greater than 10 kilometers and 'very good' if it was between seven and 10 kilometers. $73 \%$ and $12 \%$ of monitoring effort on the MGL was undertaken at 'excellent' and 'very good' visibility levels, respectively (Table 12). The entire predicted harassment zone radii, BZs , and EZs were not visible on multiple occasions, mainly due to precipitation and reduced lighting before sunrise and after sunset and during night-time visual monitoring. During these times, it is possible that protected species were not detected within these zones.
Table 12: Visibility during the survey (in kilometers).

| Total | $<0.05$ | $\mathbf{0 . 0 5 - 0 . 1}$ | $\mathbf{0 . 1 - 0 . 3}$ | $\mathbf{0 . 3 - 0 . 5}$ | $\mathbf{0 . 5 - 1}$ | $\mathbf{1 - 2}$ | $\mathbf{2 - 5}$ | $\mathbf{5 - 7}$ | $\mathbf{7 - 1 0}$ | $>10$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Duration (hh:mm) | $00: 00$ | $00: 53$ | $02: 13$ | $04: 50$ | $04: 24$ | $11: 19$ | $06: 29$ | $25: 09$ | $44: 58$ | $272: 25$ |

Reduced visibility was mainly attributed to periods of heavy rain, the brief periods of reduced lighting before sunrise and after sunset, and any time visual monitoring was required for a nighttime ramp-up. Precipitation was recorded during visual monitoring on the MGL for a total of 53 hours 31 minutes. Most of the precipitation recorded was light rain (50\%) or haze (28\%) (Table 13).

Table 13: Precipitation during the survey.

| Total | None | Heavy Moderate Light <br> Rain | Reavy <br> Rain | Rain | Moderate Thin <br> Fog | Haze | Sleet | Snow |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Duration <br> (hh:mm) | $319: 09$ | $03: 56$ | $03: 54$ | $26: 37$ | $00: 00$ | $01: 08$ | $03: 05$ | $14: 51$ | $00: 00$ | $00: 00$ |

The Beaufort Sea State recorded during visual monitoring ranged from level one to level seven. Most visual observations on the MGL were undertaken in conditions where the BSS was level three ( $37 \%$ ) or level four (25\%), which were considered 'good' conditions for the detection of protected species (Table 14).

Table 14: Beaufort Sea State during the survey.

| Total | B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B9 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Duration <br> (hh:mm) | $00: 00$ | $01: 45$ | $62: 46$ | $139: 08$ | $93: 17$ | $42: 46$ | $20: 58$ | $12: 00$ | $00: 00$ | $00: 00$ |

Wind speeds recorded visual monitoring ranged between one and 34 knots. Most of the visual monitoring on the MGL occurred during recorded wind speeds less than 10 knots ( $25 \%$ ) and from 10 to 15 knots (27\%) (Table 15).

Table 15: Wind speed during the survey.

| Total | $<10$ | $10-15$ | $\mathbf{1 6 - 2 0}$ | $\mathbf{2 1 - 2 5}$ | $\mathbf{2 6 - 3 0}$ | $>31$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Duration (hh:mm) | $94: 09$ | $102: 24$ | $89: 31$ | $52: 24$ | $26: 42$ | $7: 30$ |

Swell heights during visual observations were generally low, with swells of less than two meters recorded for the majority of visual observations (84\%) (Table 16).
Table 16: Swell height during the survey.

| Total | $<2 m$ | $2-4 m$ | $>4 m$ |
| :--- | :--- | :--- | :--- |
| Duration (hh:mm) | $313: 15$ | $59: 25$ | $0: 00$ |

Visual monitoring was conducted primarily when no glare (32\%) was present (Table 17). During times of moderate to severe glare, it is possible that the detection of protected species was hindered.

Table 17: Glare during the survey.

| Total | None | Mild | Moderate | Severe |
| :--- | :--- | :--- | :--- | :--- |
| Duration (hh:mm) | $120: 14$ | $72: 03$ | $83: 19$ | $97: 04$ |

## 5 MONITORING AND DETECTION RESULTS

### 5.1 Visual Detections

Visual monitoring efforts during the survey program resulted in a total of three visual detections events of protected species totaling six individuals (summarized in Appendix E). This total included two detections of dolphins and one detection of a sea turtle.
Table 18 lists the total number of detections and total number of animals recorded for each protected species observed during the survey. Photographs taken of visual detections can be found in Appendix F.

Maps of the detections of the protected species are shown in Figure 5.
Table 18: Number of visual detection records collected for each protected species during the survey.

| Species | Total Number of Detection Records | Total Number of Animals |
| :--- | :--- | :--- |
| Dolphins | 1 | 3 |
| Bottlenose dolphins | 1 | 2 |
| Unidentified dolphin | 1 | 1 |
| Sea turtles | 3 | 6 |
| Unidentified sea turtle | Total |  |

Figure 5: All protected species detections observed by common name during the survey.

## REPORT

Of the three visual detections, two detections occurred while the acoustic source was deployed and active and one detection occurred while the vessel was in transit to the survey area. The acoustic source was not deployed during this detection, therefore there is no mean closest observed approach to the source. Table 19 lists the number of each species detected during each different source activity described above as well as the species average closest approach to the source during those times. The closest distance to the source was not recorded while the source was not deployed for the remaining one detection of the three. Detections occurred in water depths ranging between 542 and 2797 meters.

Table 19: Average closest approach of protected species to the acoustic source during the survey.

| Species Detected | Regulated Source Active |  | Regulated Source Inactive |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Number of detections | Mean closest observed sapproach to source (meters) | Number of detections | Mean closest observed sapproach to source (meters) |
| Bottlenose Dolphin | - | - | 1 | - |
| Unidentified dolphin | 1 | 106 | - | - |
| Unidentified sea turtle | 1 | 160 | - | - |

In general, dolphins detected during the survey program were mainly observed porpoising and swimming below the surface while traveling at sedate or moderate paces away from or in the opposite direction as the vessel. The sea turtle detected during the survey program was mainly observed swimming below the surface and diving while traveling at a sedate pace in the opposite direction as the vessel.

### 5.1.1 Other Wildlife

Observations of other wildlife included 16 species of birds, two species of fish and one species of invertebrates. A complete list of birds and other marine wildlife observed and identified, in addition to the approximate number of individuals observed and the number of days on which they were observed, can be found in Appendix G. No adverse impacts to any other wildlife species as a result of research activities were observed.

### 5.2 Acoustic Detections

There was one acoustic detection of protected species during the survey program, which consisted of unidentifiable dolphins. The detection included one individual and occurred in water depths between 4412 meters. This detection occurred during hours of darkness with no ongoing visual monitoring. This detection occurred while the seismic source was active at full volume. The single acoustic detection consisted of high frequency click trains. This detection was unable to be tracked due to a short duration.

## 6 MITIGATION ACTION SUMMARY

There was one mitigation action implemented, a shutdown of the active source due to an unidentified sea turtle observed swimming below the surface and approaching its EZ at 160 meters. At the time of the detection, the source was at full volume on a survey line. The individual was initially observed swimming below the surface at a sedate pace, parallel and in the opposite direction as the vessel, 50 meters from the starboard beam and 335 meters from the active acoustic source. As the individual was observed entering the 150 -meter exclusion zone, a shutdown of the active source was requested and immediately implemented. The closest distance to the active source was 160 meters, whilst the closest distance to the silent source was 150 meters. The sea turtle was not observed leaving the EZ, thus clearance was given to resume source activity 16 minutes after the mitigation shutdown. In this instance, source activities were able to resume full volume after the given clearance period without a ramp-up, per the BiOp.

### 6.1 Vessel Strike Avoidance (VSA) Maneuvers

There were no VSA measures implemented for protected species during the survey.

### 6.2 Protected Species Known to Have Been Exposed to 160 Decibels or Greater of Received Sound Levels

Numerous protected species are known to occur within the survey area, including 10 species listed as endangered or threatened under the ESA. These species included four marine mammals; blue whale, fin whale, sei whale and sperm whale, four marine reptiles; green sea turtle, Kemp's Ridley sea turtle, leatherback sea turtle and loggerhead sea turtle. NSF came to a "no effect" determination for seabirds due to their unlikely presence; however, PSOs monitored for two ESA-listed sea birds, Bermuda petrel and roseate tern, in the unlikely event they were encountered in the survey area.

NMFS granted an IHA, which included an ITS, for the marine seismic survey authorizing a total of 7211 individuals from 26 species or species groups, including nine species of whales and 17 delphinid species. four species of sea turtles. Four species of whales are listed as endangered or threatened. One species group, consisting of Kogia species, was authorized for Level A harassment takes (exposure to sound pressure levels where there is a potential for auditory injury based upon each species hearing range). All individuals were authorized for Level B harassment takes (exposure to sound pressure levels equal to or greater than 160 dB re: $1 \mu \mathrm{Parms}$ ) where there is a potential for behavioral changes), including 419 takes for endangered/threatened species.
During acoustic source operations, two marine mammals, correlating to two unidentified dolphins, were observed within the predicted 160 decibel radius (where there is a potential for a behavioral response) while the acoustic source was active, constituting potential Level B takes. In addition, one unidentified sea turtle was observed within the predicted 160 decibel radius. There were no protected species observed within the predicted radius at which there is a potential for auditory injury (based upon each species hearing range and how that overlaps with the frequencies produced by the sound source), constituting potential Level A takes/exposures.

The number of potential takes may be an underestimation and, therefore, may be a minimum estimate of the actual number of protected species potentially exposed to received sound levels within the predicted Level A and Level B harassment zones. It is possible that the estimated numbers of animals recorded were underestimates due to some individuals not being visually sighted or having moved away before they were observed (Table 20).

Table 20: Number of authorized and potential Level A and B harassment takes / exposures during the survey.

|  | IHA Authorized Level B Takes/ <br> Species | Total Potential Takes/ <br> Exposures During Seismic <br> operations |
| :--- | :--- | :--- |
| Humpback whale | 2 | - |
| Fin whale | 4 | - |
| Sei whale | 8 | - |
| Minke whale | 10 | - |
| Blue whale | 1 | - |
| Sperm whale | 406 | - |
| Kogia spp. | 678 | - |

Table 21 describes the behavior of all animals, including unidentified species, which were visually observed within the predicted Level B harassment zones. There were no highly distinctive behavioral reactions observed in relation to the vessel or acoustic source during the seismic survey.
Table 21: Behavior of species visually observed to be exposed to sound pressure levels of 160 dB or greater during the survey.

| Species | Detection No. | No. Of Animals | CPA <br> Active <br> Source (meters) | Source Volume (in ${ }^{3}$ ) at CPA | Initial Behavior | Initial Direction in Relation to Vessel | Subsequent and Final Behaviors | Final Direction in Relation to Vessel |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unidentifiable shelled sea turtle | VD02 | 1 | 150 | 3300 | Swimming below surface | Parallel in opposite direction as vessel | Diving | Parallel in opposite direction as vessel |

| Species | Detection No. | No. Of Animals | CPA Active Source (meters) | Source Volume (in ${ }^{3}$ ) at CPA | Initial Behavior | Initial <br> Direction in Relation to Vessel | Subsequent and Final Behaviors | Final Direction in Relation to Vessel |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unidentified dolphin | VD03 | 2 | 106 | 2914 | Porpoising | parallel in opposite direction as vessel | Swimming below surface | away from vessel |

### 6.3 Implementation and Effectiveness of the Biological Opinion and IHA

To minimize the potential impacts to marine mammals during the seismic survey, LDEO and PSOs were prepared to implement mitigation measures whenever these protected species were detected approaching, entering, or within their designated exclusion zones as outlined in the IHA and BiOp . There was one mitigation action implemented for protected species consisting of a shut-down of the sound source for an unidentified sea turtle. The confirmation of the implementation of each term and condition of the project permit documents are described in this report.

If an injured or dead protected species was discovered, the incident was to be reported to the NMFS Office of Protected Resources (OPR), NMFS, and the NMFS Southeast Regional Stranding Coordinator as soon as possible. The report would include a detailed description of the incident (time, date, location, species identification, description of the animal, condition of the animal/carcass, observed behaviors if the animal was alive, and general circumstances under which the animal was discovered), including pictures when possible. There were no sightings of dead or injured protected species during the seismic survey.

To prevent the occurrence of the vessel striking a marine mammal during transits, PSOs and vessel crew members maintained a vigilant watch for marine mammals, and the vessel was prepared to slow down, stop, or alter course as appropriate to avoid striking a protected species. The vessel speed had to be reduced to 10 knots or less when mother/calf pairs, pods, or large assemblages of cetaceans were observed near the vessel. The vessel had to maintain the minimum separation distances as described in Table 2. If a marine mammal was sighted during transits, the vessel was to act as necessary to avoid violating the relevant separation distances (e.g., attempt to remain parallel to the animal's course, avoid excessive speed or abrupt changes in direction until the animal left the area). If marine mammals were sighted within the relevant separation distances, the vessel was required to reduce speed, shift the engines to neutral, and not engage the engines until the animals were clear of the area. If a whale entered the separation zone while the vessel was stationary, the vessel would not engage the engines until the whale has exited the zone. These requirements did not apply in any case where compliance would create an imminent and serious threat to a person or vessel, or if the vessel was restricted in maneuverability due to towed equipment. There were no instances during the survey where avoidance maneuvers were required to be implemented for protected species detections.

In the event of a ship strike of a marine mammal, the incident was to be reported to NMFS, OPR, and to the Southeast Regional Stranding Coordinator, as soon as feasible. The report would include a detailed description of the incident (date, time, location, species identification, description of the animal(s) involved, vessel speed leading up to the incident, vessel's course/heading and what operations were being conducted, status of all sound sources in use, description of avoidance measures taken if any, environmental conditions, description of the animals behavior preceding and following the strike, and estimated fate of the animal), including pictures when possible. There were no instances of the vessel striking a protected species during the survey.

PSOs likely did not detect all animals present; however, it is highly unlikely that the actual number of animals present during survey operations reached anywhere near the fully authorized levels for all species. The combination of conservative predicted mitigation zones combined with conservative take estimation by NMFS (i.e., the precautionary approach), appears for most species to have resulted in an overestimation of take and of overall impact on marine species from the activity. The monitoring and mitigation measures required by the IHAs appear to have been an effective means to protect the marine species encountered during survey operations.

## INCIDENTAL HARASSMENT AUTHORIZATION

The Lamont-Doherty Earth Observatory of Columbia University (L-DEO) is hereby authorized under section 101(a)(5)(D) of the Marine Mammal Protection Act (MMPA; 16 U.S.C. 1371(a)(5)(D)) to incidentally harass marine mammals, under the following conditions:

1. This incidental harassment authorization (IHA) is valid for one year from the date of issuance.
2. This IHA is valid only for geophysical survey activity in the Cape Fear submarine slide complex, off North Carolina in the Northwest Atlantic Ocean, as specified in L-DEO's IHA application.

## 3. General Conditions

(a) A copy of this IHA must be in the possession of L-DEO, the vessel operator, the lead protected species observer (PSO), and any other relevant designees of LDEO operating under the authority of this IHA.
(b) The species and/or stocks authorized for taking are listed in Table 1. Authorized take, by Level A and Level B harassment only, is limited to the species and numbers listed in Table 1.
(c) The taking by serious injury or death of any of the species listed in Table 1 or any taking of any other species of marine mammal is prohibited and may result in the modification, suspension, or revocation of this IHA. Any taking exceeding the authorized amounts listed in Table 1 is prohibited and may result in the modification, suspension, or revocation of this IHA.
(d) During use of the airgun array, if any marine mammal species that are not listed in Table 1 appear within or enter the Level B harassment zone (Table 3) the airgun array must be shut down.
(e) L-DEO must ensure that relevant vessel personnel and the PSO team participate in a joint onboard briefing led by the vessel operator and lead PSO to ensure that responsibilities, communication procedures, marine mammal monitoring protocols, operational procedures, and IHA requirements are clearly understood.
(f) L-DEO must notify the NMFS Southeast Regional Office (SERO) of the start and end date of seismic operations in the survey area via email (nmfs.ser.research.notification@ noaa.gov).
4. Mitigation Requirements

The holder of this Authorization is required to implement the following mitigation measures:
a. No use of airguns is allowed from November 1 through April 30 for North Atlantic right whale migration. We request L-DEO submit daily observations to SERO (kara.shervanick@noaa.gov) during any non-airgun activities that are conducted between November 1 and April 30.
b. L-DEO must use independent, dedicated, trained visual and acoustic PSOs, meaning that the PSOs must be employed by a third-party observer provider, must not have tasks other than to conduct observational effort, collect data, and communicate with and instruct relevant vessel crew with regard to the presence of marine mammals and mitigation requirements (including brief alerts regarding maritime hazards), and must have successfully completed an approved PSO training course appropriate for their designated task (visual or acoustic). Individual PSOs may perform acoustic and visual PSO duties (though not at the same time).
c. At least one visual and two acoustic PSOs must have a minimum of 90 days at-sea experience working in those roles, respectively, during a deep penetration seismic survey, with no more than 18 months elapsed since the conclusion of the at-sea experience.

## d. Visual Observation

i. During survey operations (e.g., any day on which use of the airgun array is planned to occur, and whenever the airgun array is in the water, whether activated or not), a minimum of two visual PSOs must be on duty and conducting visual observations at all times during daylight hours (i.e., from 30 minutes prior to sunrise through 30 minutes following sunset) and 30 minutes prior to and during ramp-up of the airgun array.
ii. Visual monitoring of the shutdown and buffer zones must begin no less than 30 minutes prior to ramp-up, and must continue until one hour after use of the acoustic source ceases or until 30 minutes past sunset.
iii. Visual PSOs must coordinate to ensure $360^{\circ}$ visual coverage around the vessel from the most appropriate observation posts, and must conduct visual observations using binoculars and the naked eye while free from distractions and in a consistent, systematic, and diligent manner. Estimated harassment zones are provided in Table 2 and 3 for reference.
iv. Visual PSOs must immediately communicate all observations to the acoustic PSO(s) on duty, including any determination by the PSO regarding species identification, distance, and bearing and the degree of confidence in the determination.
v. During good conditions (e.g., daylight hours; Beaufort sea state (BSS) 3 or less), visual PSOs must conduct observations when the airgun array is not
operating for comparison of sighting rates and behavior with and without use of the airgun array and between acquisition periods, to the maximum extent practicable.
vi. Visual PSOs may be on watch for a maximum of four consecutive hours followed by a break of at least one hour between watches and may conduct a maximum of 12 hours of observation per 24 -hour period. Combined observational duties (visual and acoustic but not at same time) may not exceed 12 hours per 24-hour period for any individual PSO.
e. Acoustic Monitoring
i. The source vessel must use a towed passive acoustic monitoring system (PAM) which must be monitored by, at a minimum, one on-duty acoustic PSO beginning at least 30 minutes prior to ramp-up and at all times during use of the airgun array.
ii. When both visual and acoustic PSOs are on duty, all detections must be immediately communicated to the remainder of the on-duty PSO team for potential verification of visual observations by the acoustic PSO or of acoustic detections by visual PSOs.
iii. Acoustic PSOs may be on watch for a maximum of four consecutive hours followed by a break of at least one hour between watches and may conduct a maximum of 12 hours of observation per 24 -hour period. Combined observational duties may not exceed 12 hours per 24 -hour period for any individual PSO.
iv. Survey activity may continue for 30 minutes when the PAM system malfunctions or is damaged, while the PAM operator diagnoses the issue. If the diagnosis indicates that the PAM system must be repaired to solve the problem, operations may continue for an additional five hours without acoustic monitoring during daylight hours only under the following conditions:

1. Sea state is less than or equal to BSS 4;
2. With the exception of delphinids, no marine mammals detected solely by PAM in the applicable shutdown zone in the previous two hours;
3. NMFS is notified via email as soon as practicable with the time and location in which operations began occurring without an active PAM system; and
4. Operations with an active acoustic source, but without an operating PAM system, do not exceed a cumulative total of five hours in any 24-hour period.

## f. Shutdown zones and buffer zones

i. Except as provided in $4(\mathrm{f})(\mathrm{ii})$ and $4(\mathrm{f})(\mathrm{iii})$, the PSOs must establish and monitor a $500-\mathrm{m}$ shutdown zone and additional $500-\mathrm{m}$ buffer zone (total 1000 $\mathrm{m})$. The $1000-\mathrm{m}$ zone must serve to focus observational effort but not limit such effort; observations of marine mammals beyond this distance shall also be recorded as described in 5(d) below and/or trigger shutdown as described in $4(\mathrm{~g})$ (iv) below, as appropriate. The shutdown zone encompasses the area at and below the sea surface out to a radius of 500 m from the edges of the airgun array (rather than being based on the center of the array or around the vessel itself) ( $0-500 \mathrm{~m}$ ). The buffer zone encompasses the area at and below the sea surface from the edge of the shutdown zone, out to a radius of 1000 meters from the edges of the airgun array ( $500-1000 \mathrm{~m}$ ). During use of the acoustic source, occurrence of marine mammals within the buffer zone (but outside the shutdown zone) must be communicated to the operator to prepare for the potential shutdown of the acoustic source. PSOs must monitor the shutdown zone and buffer zone for a minimum of 30 minutes prior to ramp-up (i.e., pre-start clearance).
ii. An extended 1500 m shutdown zone must be established for all beaked whales, dwarf and pygmy sperm whales, a large whale with a calf, and groups of six or more large whales. No buffer zone is required.
iii. The acoustic source must be shut down upon detection (visual or acoustic) of a North Atlantic right whale at any distance.
g. Pre-start clearance and Ramp-up
i. A ramp-up procedure must be followed at all times as part of the activation of the airgun array, except as described under 4(e)(iv).
ii. Ramp-up must not be initiated if any marine mammal is within the shutdown or buffer zone. If a marine mammal is observed within the shutdown zone or the buffer zone during the 30 minute pre-start clearance period, ramp-up may not begin until the animal(s) has been observed exiting the zone or until an additional time period has elapsed with no further sightings ( 15 minutes for small odontocetes, and 30 minutes for mysticetes and all other odontocetes).
iii. Ramp-up must begin by activating a single airgun of the smallest volume in the array and must continue in stages by doubling the number of active elements at the commencement of each stage, with each stage of approximately the same duration. Duration must not be less than 20 minutes. The operator must provide information to the PSO documenting that appropriate procedures were followed.
iv. PSOs must monitor the shutdown and buffer zones during ramp-up, and rampup must cease and the source must be shut down upon visual observation or acoustic detection of a marine mammal within the shutdown zone. Once ramp-up has begun, observations of marine mammals within the buffer zone do not require shutdown, but such observation must be communicated to the operator to prepare for the potential shutdown.
v. Where operational planning cannot reasonably avoid such circumstances ramp-up may occur at times of poor visibility, including nighttime, if appropriate acoustic monitoring has occurred with no detections in the 30 minutes prior to beginning ramp-up. Acoustic source activation may only occur at times of poor visibility where operational planning cannot reasonably avoid such circumstances.
vi. If the acoustic source is shut down for brief periods (i.e., less than 30 minutes) for reasons other than that described for shutdown (e.g., mechanical difficulty), it may be activated again without ramp-up if PSOs have maintained constant visual and/or acoustic observation and no visual or acoustic detections of marine mammals have occurred within the applicable shutdown zone. For any longer shutdown, pre-start clearance observation and ramp-up are required. For any shutdown at night or in periods of poor visibility (e.g., BSS 4 or greater), ramp-up is required, but if the shutdown period was brief and constant observation was maintained, pre-start clearance watch is not required.
vii. Testing of the acoustic source involving all elements requires ramp-up. Testing limited to individual source elements or strings does not require rampup but does require pre-start clearance watch.
h. Shutdown requirements
i. Any PSO on duty has the authority to delay the start of survey operations or to call for shutdown of the airgun array.
ii. The operator must establish and maintain clear lines of communication directly between PSOs on duty and crew controlling the acoustic source to ensure that shutdown commands are conveyed swiftly while allowing PSOs to maintain watch.
iii. When the airgun array is active (i.e., anytime one or more airguns is active, including during ramp-up) and (1) a marine mammal (excluding delphinids of the species described in 4(h)(iv)) appears within or enters the shutdown zone and/or (2) a marine mammal is detected acoustically and localized within the shutdown zone, the airgun array must be shut down. When shutdown is called for by a PSO, the airgun array must be immediately deactivated. Any dispute regarding a PSO shutdown must be resolved after deactivation.
iv. The shutdown requirement described in 4(h)(iii) shall be waived for small dolphins of the following genera: Delphinus, Lagenodelphis, Stenella, Steno, and Tursiops.

1. If a dolphin of these genera is visually and/or acoustically detected and localized within the shutdown zone, no shutdown is required unless the acoustic PSO or a visual PSO confirms the individual to be of a species other than those listed above, in which case a shutdown is required.
2. If there is uncertainty regarding identification, visual PSOs may use best professional judgement in making the decision to call for a shutdown.
v. Upon implementation of shutdown, the source may be reactivated after the marine mammal(s) has been observed exiting the applicable shutdown zone (i.e., animal is not required to fully exit the buffer zone where applicable) or following a clearance period ( 15 minutes for small odontocetes, and 30 minutes for mysticetes and all other odontocetes) with no further observation of the marine mammal(s).
vi. Shutdown of the array is required upon observation of a species for which authorization has not been granted, or a species for which authorization has been granted but the authorized number of takes has been met, approaching or observed within any harassment zone.
i. Vessel strike avoidance
i. Vessel operators and crew must maintain a vigilant watch for all marine mammals and slow down, stop their vessel, or alter course, as appropriate and regardless of vessel size, to avoid striking any marine mammals. A visual observer aboard the vessel must monitor a vessel strike avoidance zone around the vessel (distances stated below). Visual observers monitoring the vessel strike avoidance zone may be third-party observers (i.e., PSOs) or crew members, but crew members responsible for these duties must be provided sufficient training to 1 ) distinguish marine mammals from other phenomena and 2) broadly to identify a marine mammal to taxonomic group (i.e., as a right whale, other large whale, or other marine mammal).
ii. All survey vessels, regardless of size, must observe a $10-\mathrm{kn}$ speed restriction in specific areas designated by NMFS for the protection of North Atlantic right whales from vessel strikes. These include all Seasonal Management Areas (SMA) established under 50 CFR 224.105 (when in effect), any dynamic management areas (DMA) (when in effect), and Slow Zones. See www.fisheries.noaa.gov/national/endangered-species-conservation/reducing-ship-strikes-north-atlantic-right-whales for specific detail regarding these areas.
iii. Vessel speeds must be reduced to 10 knots or less when mother/calf pairs, pods, or large assemblages of cetaceans are observed near a vessel.
iv. The vessel must maintain a minimum separation distance of 500 m from North Atlantic right whales. If a whale is observed but cannot be confirmed as a species other than a right whale, the vessel operator must assume that it is a right whale and take appropriate action.
v. The vessel must maintain a minimum separation distance of 100 m from sperm whales and all other baleen whales.
vi. The vessel must, to the maximum extent practicable, attempt to maintain a minimum separation distance of 50 m from all other marine mammals, with an understanding that at times this may not be possible (e.g., for animals that approach the vessel).
vii. When marine mammals are sighted while a vessel is underway, the vessel must take action as necessary to avoid violating the relevant separation distance (e.g., attempt to remain parallel to the animal's course, avoid excessive speed or abrupt changes in direction until the animal has left the area). If marine mammals are sighted within the relevant separation distance, the vessel must reduce speed and shift the engine to neutral, not engaging the engines until animals are clear of the area. This does not apply to any vessel towing gear or any vessel that is navigationally constrained.
viii. These requirements do not apply in any case where compliance would create an imminent and serious threat to a person or vessel or to the extent that a vessel is restricted in its ability to maneuver and, because of the restriction, cannot comply.

## 5. Monitoring Requirements

Monitoring must be conducted in accordance with the following requirements:
a. The operator must provide PSOs with bigeye reticle binoculars (e.g., $25 \times 150 ; 2.7$ view angle; individual ocular focus; height control) of appropriate quality solely for PSO use. These must be pedestal-mounted on the deck at the most appropriate vantage point that provides for optimal sea surface observation, PSO safety, and safe operation of the vessel.
b. The operator must work with the selected third-party observer provider to ensure PSOs have all equipment (including backup equipment) needed to adequately perform necessary tasks, including accurate determination of distance and bearing to observed marine mammals. Such equipment, at a minimum, must include:
i. PAM must include a system that has been verified and tested by an experienced acoustic PSO that will be using it during the trip for which monitoring is required.
ii. Reticle binoculars (e.g., $7 \times 50$ ) of appropriate quality (at least one per PSO, plus backups).
iii. Global Positioning Unit (GPS) (plus backup).
iv. Digital single-lens reflex cameras of appropriate quality that capture photographs and video (plus backup).
v. Compass (plus backup)
vi. Radios for communication among vessel crew and PSOs (at least one per PSO, plus backups).
vii. Any other tools necessary to adequately perform necessary PSO tasks.
c. Protected Species Observers (PSOs, Visual and Acoustic) Qualifications
i. PSOs must have successfully completed an acceptable PSO training course appropriate for their designated task (visual or acoustic). Acoustic PSOs are required to complete specialized training for operating PAM systems and are encouraged to have familiarity with the vessel with which they will be working.
ii. NMFS must review and approve PSO resumes.
iii. NMFS shall have one week to approve PSOs from the time that the necessary information is submitted, after which PSOs meeting the minimum requirements shall automatically be considered approved.
iv. One visual PSO with experience as shown in 4(c) shall be designated as the lead for the PSO team. The lead must coordinate duty schedules and roles for the PSO team and serve as primary point of contact for the vessel operator. (Note that the responsibility of coordinating duty schedules and roles may instead be assigned to a shore-based, third-party monitoring coordinator.) To the maximum extent practicable, the lead PSO must devise the duty schedule such that experienced PSOs are on duty with those PSOs with appropriate training but who have not yet gained relevant experience.
v. PSOs must successfully complete relevant training, including completion of all required coursework and passing ( 80 percent or greater) a written and/or oral examination developed for the training program.
vi. PSOs must have successfully attained a bachelor's degree from an accredited college or university with a major in one of the natural sciences, a minimum of 30 semester hours or equivalent in the biological sciences, and at least one undergraduate course in math or statistics.
vii. The educational requirements may be waived if the PSO has acquired the relevant skills through alternate experience. Requests for such a waiver must be submitted to NMFS and must include written justification. Requests must be granted or denied (with justification) by NMFS within one week of receipt of submitted information. Alternate experience that may be considered includes, but is not limited to (1) secondary education and/or experience comparable to PSO duties; (2) previous work experience conducting academic, commercial, or government-sponsored marine mammal surveys; or (3) previous work experience as a PSO; the PSO should demonstrate good standing and consistently good performance of PSO duties.

## d. Data Collection

i. PSOs must use standardized data collection forms, whether hard copy or electronic. PSOs must record detailed information about any implementation of mitigation requirements, including the distance of animals to the acoustic source and description of specific actions that ensued, the behavior of the animal(s), any observed changes in behavior before and after implementation of mitigation, and if shutdown was implemented, the length of time before any subsequent ramp-up of the acoustic source. If required mitigation was not implemented, PSOs should record a description of the circumstances.
ii. At a minimum, the following information must be recorded:

1. Vessel name and call sign;
2. PSO names and affiliations;
3. Date and participants of PSO briefings (as discussed in General Requirement);
4. Dates of departure and return to port with port name;
5. Dates and times (Greenwich Mean Time) of survey effort and times corresponding with PSO effort;
6. Vessel location (latitude/longitude) when survey effort began and ended and vessel location at beginning and end of visual PSO duty shifts;
7. Vessel heading and speed at beginning and end of visual PSO duty shifts and upon any line change;
8. Environmental conditions while on visual survey (at beginning and end of PSO shift and whenever conditions changed significantly), including BSS and any other relevant weather conditions including cloud cover, fog, sun glare, and overall visibility to the horizon;
9. Factors that may have contributed to impaired observations during each PSO shift change or as needed as environmental conditions changed (e.g., vessel traffic, equipment malfunctions); and
10. Survey activity information, such as acoustic source power output while in operation, number and volume of airguns operating in the array, tow depth of the array, and any other notes of significance (i.e., pre-start clearance, ramp-up, shutdown, testing, shooting, ramp-up completion, end of operations, streamers, etc.).
iii. Upon visual observation of any marine mammals, the following information must be recorded:
11. Watch status (sighting made by PSO on/off effort, opportunistic, crew, alternate vessel/platform);
12. PSO who sighted the animal;
13. Time of sighting;
14. Vessel location at time of sighting;
15. Water depth;
16. Direction of vessel's travel (compass direction);
17. Direction of animal's travel relative to the vessel;
18. Pace of the animal;
19. Estimated distance to the animal and its heading relative to vessel at initial sighting;
20. Identification of the animal (e.g., genus/species, lowest possible taxonomic level, or unidentified) and the composition of the group if there is a mix of species;
21. Estimated number of animals (high/low/best);
22. Estimated number of animals by cohort (adults, yearlings, juveniles, calves, group composition, etc.);
23. Description (as many distinguishing features as possible of each individual seen, including length, shape, color, pattern, scars or markings, shape and size of dorsal fin, shape of head, and blow characteristics);
24. Detailed behavior observations (e.g., number of blows/breaths, number of surfaces, breaching, spyhopping, diving, feeding, traveling; as explicit and detailed as possible; note any observed changes in behavior);
25. Animal's closest point of approach (CPA) and/or closest distance from any element of the acoustic source;
26. Platform activity at time of sighting (e.g., deploying, recovering, testing, shooting, data acquisition, other); and
27. Description of any actions implemented in response to the sighting (e.g., delays, shutdown, ramp-up) and time and location of the action.
iv. If a marine mammal is detected while using the PAM system, the following information must be recorded:
28. An acoustic encounter identification number, and whether the detection was linked with a visual sighting;
29. Date and time when first and last heard;
30. Types and nature of sounds heard (e.g., clicks, whistles, creaks, burst pulses, continuous, sporadic, strength of signal);
31. Any additional information recorded such as water depth of the hydrophone array, bearing of the animal to the vessel (if determinable), species or taxonomic group (if determinable), spectrogram screenshot, and any other notable information.

## 6. Reporting

(a) L-DEO must submit a draft comprehensive report to NMFS on all activities and monitoring results within 90 days of the completion of the survey or expiration of the IHA, whichever comes sooner. A final report must be submitted within 30 days following resolution of any comments on the draft report. The draft report must include the following:
(i) Summary of all activities conducted and sightings of marine mammals near the activities;
(ii) Summary of all data required to be collected (see condition 5(d));
(iii) Full documentation of methods, results, and interpretation pertaining to all monitoring;
(iv) Summary of dates and locations of survey operations (including (1) the number of days on which the airgun array was active and (2) the percentage of time and total time the array was active during daylight vs. nighttime hours (including dawn and dusk)) and all marine mammal sightings (dates, times, locations, activities, associated survey activities);
(v) Geo-referenced time-stamped vessel tracklines for all time periods during which airguns were operating. Tracklines should include points recording any change in airgun status (e.g., when the airguns began operating, when they were turned off, or when they changed from full array to single gun or vice versa);
(vi) GIS files in ESRI shapefile format and UTC date and time, latitude in decimal degrees, and longitude in decimal degrees. All coordinates must be referenced to the WGS84 geographic coordinate system; and
(vii) Raw observational data.
(b) Reporting Injured or Dead Marine Mammals
(i) Discovery of Injured or Dead Marine Mammal - In the event that personnel involved in the survey activities covered by the authorization discover an injured or dead marine mammal, L-DEO must report the incident to the Office of Protected Resources (OPR) (301-427-8401), NMFS and the NMFS Southeast Regional Stranding Coordinator (305-3614586) as soon as feasible. The report must include the following information:

1. Time, date, and location (latitude/longitude) of the first discovery (and updated location information if known and applicable);
2. Species identification (if known) or description of the animal(s) involved;
3. Condition of the animal(s) (including carcass condition if the animal is dead);
4. Observed behaviors of the animal(s), if alive;
5. If available, photographs or video footage of the animal(s); and
6. General circumstances under which the animal was discovered.
(ii) Vessel Strike - In the event of a ship strike of a marine mammal by any vessel involved in the activities covered by the authorization, L-DEO must report the incident to OPR, NMFS and to the Southeast Regional Stranding Coordinator as soon as feasible. The report must include the following information:
7. Time, date, and location (latitude/longitude) of the incident;
8. Species identification (if known) or description of the animal(s) involved;
9. Vessel's speed during and leading up to the incident;
10. Vessel's course/heading and what operations were being conducted (if applicable);
11. Status of all sound sources in use;
12. Description of avoidance measures/requirements that were in place at the time of the strike and what additional measures were taken, if any, to avoid strike;
13. Environmental conditions (e.g., wind speed and direction, Beaufort sea state, cloud cover, visibility) immediately preceding the strike;
14. Estimated size and length of animal that was struck;
15. Description of the behavior of the marine mammal immediately preceding and following the strike;
16. If available, description of the presence and behavior of any other marine mammals immediately preceding the strike;
17. Estimated fate of the animal (e.g., dead, injured but alive, injured and moving, blood or tissue observed in the water, status unknown, disappeared); and
18. To the extent practicable, photographs or video footage of the animal(s).
(c) Reporting Species of Concern
(i) If a North Atlantic right whale is observed at any time by PSOs or personnel on any project vessels, during surveys or during vessel transit, LDEO must immediately report sighting information to the NMFS North Atlantic Right Whale Sighting Advisory System: 877-WHALE-HELP (877-942-5343). North Atlantic right whale sightings in any location must
also be reported to the U.S. Coast Guard via channel 16 and through the WhaleAlert app (http://www.whalealert.org/).
19. Actions to minimize additional harm to live-stranded (or milling) marine mammals - In the event of a live stranding (or near-shore atypical milling) event within 50 km of the survey operations, where the NMFS stranding network is engaged in herding or other interventions to return animals to the water, the Director of OPR, NMFS (or designee) will advise L-DEO of the need to implement shutdown procedures for all active acoustic sources operating within 50 km of the stranding. Shutdown procedures for live stranding or milling marine mammals include the following:
(a) If at any time, the marine mammal(s) die or are euthanized, or if herding/intervention efforts are stopped, the Director of OPR, NMFS (or designee) will advise L-DEO that the shutdown around the animals' location is no longer needed.
(b) Otherwise, shutdown procedures will remain in effect until the Director of OPR, NMFS (or designee) determines and advises L-DEO that all live animals involved have left the area (either of their own volition or following an intervention).
(c) If further observations of the marine mammals indicate the potential for restranding, additional coordination with L-DEO will be required to determine what measures are necessary to minimize that likelihood (e.g., extending the shutdown or moving operations farther away) and to implement those measures as appropriate.
(d) Additional information requests - If NMFS determines that the circumstances of any marine mammal stranding found in the vicinity of the activity suggest investigation of the association with survey activities is warranted, and an investigation into the stranding is being pursued, NMFS will submit a written request to L-DEO indicating that the following initial available information must be provided as soon as possible, but no later than 7 business days after the request for information.
(i) Status of all sound source use in the 48 hours preceding the estimated time of stranding and within 50 km of the discovery/notification of the stranding by NMFS; and
(ii) If available, description of the behavior of any marine mammal(s) observed preceding (i.e., within 48 hours and 50 km ) and immediately after the discovery of the stranding.

In the event that the investigation is still inconclusive, the investigation of the association of the survey activities is still warranted, and the investigation is still being pursued, NMFS may provide additional information requests, in writing,
regarding the nature and location of survey operations prior to the time period above.
8. This Authorization may be modified, suspended or revoked if the holder fails to abide by the conditions prescribed herein (including, but not limited to, failure to comply with monitoring or reporting requirements), or if NMFS determines: (1) the authorized taking is likely to have or is having more than a negligible impact on the species or stocks of affected marine mammals, or (2) the prescribed measures are likely not or are not effecting the least practicable adverse impact on the affected species or stocks and their habitat.

## 9. Renewals

On a case-by-case basis, NMFS may issue a one-time, one-year Renewal IHA following notice to the public providing an additional 15 days for public comments when (1) up to another year of identical, or nearly identical, activities are planned or (2) the specified activities would not be completed by the time this IHA expires and a Renewal would allow for completion of the activities, provided all of the following conditions are met:
(a) A request for renewal is received no later than 60 days prior to the needed Renewal IHA effective date (the Renewal IHA expiration date cannot extend beyond one year from expiration of this IHA).
(b) The request for renewal must include the following:
(i) An explanation that the activities to be conducted under the requested Renewal IHA are identical to the activities analyzed for this IHA, are a subset of the activities, or include changes so minor that the changes do not affect the previous analyses, mitigation and monitoring requirements, or take estimates (with the exception of reducing the type or amount of take).
(ii) A preliminary monitoring report showing the results of the required monitoring to date and an explanation showing that the monitoring results do not indicate impacts of a scale or nature not previously analyzed or authorized.
(c) Upon review of the request for Renewal, the status of the affected species or stocks, and any other pertinent information, NMFS determines that there are no more than minor changes in the activities, the mitigation and monitoring measures will remain the same and appropriate, and the findings made in support of this IHA remain valid.

Kimberly Damon-Randall,
Director, Office of Protected Resources,
National Marine Fisheries Service.

Table 1. Authorized take numbers, by species

| Species | Authorized Take |  |
| :--- | :---: | :---: |
|  | Level B | Level A |
| Humpback whale | 2 | 0 |
| Fin whale | 4 | 0 |
| Sei whale | 8 | 0 |
| Minke whale | 10 | 0 |
| Blue whale | 406 | 0 |
| Sperm whale | 678 | 31 |
| Kogia spp. | 396 | 0 |
| Cuvier's beaked whale | 420 | 0 |
| Mesoplodont Beaked whales | 385 | 0 |
| Pilot whales | 82 | 0 |
| Rough-toothed dolphin | 1,477 | 0 |
| Bottlenose dolphin | 14 | 0 |
| Atlantic white-sided dolphin | 114 | 0 |
| Pantropical spotted dolphin | 1,237 | 0 |
| Atlantic spotted dolphin | 41 | 0 |
| Spinner dolphin | 79 | 0 |
| Clymene dolphin | 45 | 0 |
| Striped dolphin | 163 | 0 |
| Fraser's dolphin | 189 | 0 |
| Risso's dolphin | 56 | 0 |
| Common dolphin | 83 | 0 |
| Melon-headed whale | 6 | 0 |
| Pygmy killer whale | 6 | 0 |
| False killer whale | 4 | 0 |
| Killer whale | 3 | 0 |
| Harbor porpoise |  |  |

Table 2. Modeled Radial Distances (m) to Isopleths Corresponding to Level A Harassment Thresholds.

| Airgun Configuration | Threshold | Level A harassment zone (m) |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | MF <br> Cetaceans | HF <br> Cetaceans |  |
| 18 airgun array $\left(3300 \mathrm{in}^{3}\right)$ | SELcum | 101.9 | 0 | 0.5 |
|  | Peak | 23.3 | 11.2 | 116.9 |

Table 3. Modeled Radial Distances (m) to Isopleths Corresponding to Level B Harassment Threshold.

| Airgun Configuration | Water Depth (m) | Level B harassment zone (m) |
| :---: | :---: | :---: |
| 18 airgun array (3300 <br> $\left.\mathrm{in}^{3}\right)$ | $>1000 \mathrm{~m}$ | 2,886 |
|  | $100-1000 \mathrm{~m}$ | 4,329 |

| Description of other vessels in the nearby vicinity (if any) | Visual Detection Narrative (be as detailed as possible - include all information relevant to the detection, especially any changes in relation to source activity and distances from the source and EZ - times, distances, behaviours, locations, headings, mitigation actions, etc.) |
| :---: | :---: |
| none | At 20:10 UTC, three common bottlenose dolphins, two adults and one juvenile, were observed surfacing approximately 200 meters from the vessel at a bearing of 330 degrees on the portside. Individuals were seen approaching the vessel with a heading of 150 degrees and swimming just beneath the surface at a moderate pace. At 20:13 UTC, the dolphins were last seen crossing ahead of the bow with a heading of 70 degrees, 100 meters from the vessel and along a bearing of 350 degrees. This was the closest approach to the vessel. At the time of the detection, the vessel was in transit to the prospect area and all seismic gear was onboard. |
| none | At 13:57 UTC, the body of one unidentifiable shelled sea turtle was detected along a bearing of 55 degrees, 50 meters from the starboard beam and 335 meters from the active acoustic source while on a survey line. The turtle was sedately swimming below the surface of the water, heading parallel and in the opposite direction as the vessel. As the turtle continued on the same heading, past the stern of the vessel, it approached its Shut-Down Zone at 13:58 UTC. At this time, a mitigation action consisting of a shut-down of the acoustic source was immediately requested and implemented. This was the turtle's closest approach to the active source at 160 meters. The sea turtle was last detected within seconds of the mitigation action at 13:59 UTC along a bearing of 150 degrees, 85 meters from the starboard stern and 150 meters from the now silent acoustic source. This turtle is considered to be a potential Level B take. The source resumed full volume at 14:14 UTC. |
| none | At 13:30 UTC, two unidentified dolphins were detected along a bearing of 200 degrees, 270 meters from the port stern and 106 meters from the active acoustic source, while on a survey line. The dolphins were sedately porpoising parallel and in the opposite direction as the vessel. Due to low lighting and choppy seas, as wells as the animals not surfacing, no identification was able to be made. In addition, there was no mitigation action requested per the IHA for shut-down exemption species. The pod was last detected at 13:32 UTC along a bearing of 210 degrees, 350 degrees from the port stern and 122 meters from the active source. Dolphins changed heading to 220 degrees, away from the vessel and swam with a moderate pace, below the surface of the water. These dolphins are considered to be potential Level B takes. |

Acoustic Detection Narrative (be as detailed as possible - include all information relevant to the and with a peak amplitude of 140.20 decibels. The delphinid was not aurally detected and clicks could not be tracked due to the brief nature of the detection. No mitigation actions were required and this animal was not considered to be a potential take.
detection, especially any changes in relation to source activity and distances from the source and EZ - times, distances, bearings, tow depth of the hydrophone cable, mitigation actions, etc.)

At 7:05 UTC, clicks from at least one unidentified dolphin were observed on the high frequency click detector at a bearing of 90 degrees with an amplitude of 120 decibels. The vessel was at full volume while on a survey line. The hydrophone cable was towing at a depth of 20.5 meters. At the same time, clicks could be seen on the low frequency spectrogram and ranged between 21.58 and 24 kHz . The dolphin clicks were last detected at 7:05 UTC, at a bearing of 45 degrees

| BASIC DATA FORM |  |
| :--- | :--- |
| LDEO Project Number | MGL2306 |
| Seismic Contractor | LDEO |
| Area Surveyed During Reporting Period | Northwest Atlantic Ocean, North Carolina coast |
| Survey Type | 2 D seismic |
| Vessel and/or Rig Name | Marcus G. Langseth |
| Permit Number | IHA issued and BiOp issued on 05 May 2023 |
| Location / Distance of Source Deployment | 304 meters astern from NRP in PSO tower |
| Water Depth in survey area | Between 300 and 5200 meters |
| Dates of project | 09 May 2023 |
| Total through | 03 June 2023 |
| Time source operating - all power levels: | $497: 44$ |
| Time source operating on survey lines: | $481: 17$ |
| Amount of time single 40 in ${ }^{3}$ element operations: | $13: 23$ |
| Amount of time in ramp-up: | N/A |
| Number daytime ramp-ups: | $02: 58$ |
| Number of nighttime ramp-ups: | 4 |
| Number of ramp-ups from mitigation source: | 4 |
| Amount of time conducted in source testing: | N/A |
| Duration of visual observations: | $00: 06$ |
| Duration of observations while source active: | $372: 40$ |
| Duration of observation during source silence: | $313: 25$ |
| Duration of acoustic monitoring: | $59: 15$ |
| Duration of acoustic monitoring while source active: | $518: 50$ |
| Duration of acoustic monitoring during source | $497: 44$ |
| silence: | $21: 06$ |
| Duration of simultaneous acoustic and visual | $327: 15$ |
| monitoring: | Cassandra Frey |
| Lead Protected Species Observer: | Daniela Durazo, Kristal Muhammad, Jo-Ann Sookar, |
| Protected Species Observers on the Langseth: | Shelby Tobin |
| Number of Marine Mammal Visual Detections: | 1 |
| Number of Marine Mammal Acoustic Detections: | 1 |
| Number of Simultaneous Visual and Acoustic | 0 |
| Detections: | Number of Sea Turtle Detections: |
| Total Number of Protected Species Detections: | 3 |
| List Mitigation Actions | 1 |
| Duration of Mitigation Actions: | 1 Shutdown for an unidentified sea turtle |
|  | $00: 16$ |
